1964-1

SEISMOLOGICAL BULLETIN

JANUARY - DECEMBER 1964

This report lists the P phase recordings obtained at the Seismological stations maintained by the Seismological Service of Canada. All earthquakes reported by station operators are included except for local earthquakes with an estimated magnitude less than 3. In this report, the format of earlier bulletins has been revised and modified. The association of many of the station readings with U.S.C.G.S.-determined earthquakes is no longer listed, and epicentral and instrumental data on local earthquakes no longer included. However a separate bulletin containing full information on Canadian earthquakes during 1964 is under preparation. The seismological stations are divided into two divisions.

EASTERN DIVISION

Alert, N.W.T. - station code, ALE

Owned and operated by the Dominion Observatory. Station seismologist during 1964 was C.H. McCloughan, succeeded by J. Hogg.

Coppermine, N.W.T. - station code, CMC

Owned by the Dominion Observatory. Operated under contract for the Dominion Observatory by the Radiosonde Division, Meteorological Branch, Department of Transport.

Edmonton, Alberta - station code, EDM

Owned by the University of Alberta. Operated under contract for the Dominion Observatory by the University of Alberta.

Frobisher, N.W.T. - station code, FBC

Owned by the Dominion Observatory. Operated under contract for the Dominion Observatory by the Radiosonde Division, Meteorological Branch, Department of Transport.

Halifax, Nova Scotia - station code, HAL

Owned by the Dominion Observatory. Operated under contract for the Dominion Observatory by Dalhousie University.

London, Ontario - station code, LND

Owned by the Dominion Observatory. Operated under contract for the Dominion Observatory by the University of Western Ontario.

Montreal, Quebec - station code, MNT

Owned and operated by Jean de Brebeuf College with contract support from the Dominion Observatory (courtesy, M. Buist, S.J., Director).

EASTERN DIVISION (cont'd)

Mould Bay, N.W.T. - station code, MBC

Owned and operated by the Dominion Observatory. Station seismologist during 1964 was G. Yada succeeded by W.T. Piché.

Ottawa, Ontario - station code, OTT

Owned and operated by the Dominion Observatory.

Resolute, N.W.T. - station code, RES

Owned and operated by the Dominion Observatory. Station seismologist during 1964 was G. Bavaria succeeded by O.J. Jensen.

Saint John's, Newfoundland - station code, STJ

Owned by the Dominion Observatory. Operated under contract for the Dominion Observatory by Memorial University.

Scarborough, Ontario - station code SCB

Owned by the Dominion Observatory. Operated under contract for the Dominion Observatory by the Radiosonde Division, Meteorological Branch, Department of Transport.

Schefferville, Quebec - station code, SCH

Owned by the Dominion Observatory. Operated under contract for the Dominion Observatory by McGill University Sub-Arctic Research Laboratory.

Sept-Isles, Quebec - station code, SIC

Owned and operated by the North Shore and Labrador Railway Company, Sept-Isles, P.Q., with contract support from the Dominion Observatory.

Seven Falls, Quebec - station code, SFA

Owned by the Dominion Observatory. Operated by Quebec Hydro for the Dominion Observatory.

Shawinigan Falls, Quebec - station code, SHF

Owned by the Shawinigan Water & Power Company. Operated by the Company for the Dominion Observatory.

Yellowknife, N.W.T. - station code, YKC

Owned and operated by the Dominion Observatory. Station seismologists during 1964 were R.L. Hewitt and M.A. Nimmo.

WESTERN DIVISION

Banff, Alberta - station code, BAN

Operated by the Banff School of Fine Arts with contract support from the Dominion Observatory.

WESTERN DIVISION (Cont'd)

Penticton, British Columbia - station code, PNT

Owned and operated by the Dominion Observatory. Station seismologist during 1964 was W.H. McNaughton.

Port Hardy, British Columbia - station code, PHC

Owned by the Dominion Observatory. Operated under contract for the Dominion Observatory by the Radiosonde Division, Meteorological Branch, Department of Transport.

Victoria, British Columbia - station code, VIC

Owned and operated by the Dominion Observatory. The operating centre of the western division is the Dominion Astrophysical Observatory, Department of Mines and Technical Surveys, R.R. #7, Victoria, B.C.

First-order standard stations commissioned during 1964 were St. John's, Newfoundland, on June 1st, and Yellowknife, N.W.T., on July 15th. No station was closed.

Records for all stations of the Seismological Service are stored on 35-mm microfilm in Ottawa. Positive microfilm copies, or full-scale prints, are available to cooperating institutions on request to the Chief of the Division of Seismology, Dominion Observatory, Carling Avenue, Ottawa, Ontario, Canada.

Magnification curves for all the various seismographs operated at the stations are found on the following pages: an estimated calibration only is available for Banff. The remaining curves are obtained by application of the Willmore bridge method on site. Earlier bulletins have given an explanation of these curves: the magnification and acceleration sensitivity of any instrument is simply determined by multiplying the velocity sensitivity by $\frac{2\pi}{T}$ or $\frac{T}{2\pi}$ respectively. Earlier bulletins have contained typographical errors in these multipliers. The magnification curves show the periods of the seismometers and the galvanometers, and summary information on the coordinates, altitude, foundation material and date of calibration is included.

The phase response as a function of period of the various seismographs has been calculated in Ottawa, whenever useful, by using a digital computer. Such information is available on request. When the Canadian standard seismic network is nearer completion, and some instrumental settings are no longer experimental, a bulletin will be issued containing the phase response calibration curves.

Following the calibration curves, computer listings are given of the P phases recorded at the stations of the network. This information is identical to that supplied immediately from certain selected stations to the United States Coast and Geodetic Survey for preliminary epicentral determinations, and from all stations with a time lag of several months to the International Seismological Research Centre and elsewhere for the definitive epicentral catalogues. The station three-letter code is followed by

the day of the month, the P onset in hours, minutes and seconds and either emergent, EP, or impulsive, IP, phase character. Wherever possible the direction of first motion of the short period vertical seismograph is indicated by either a C for compression or a D for dilatation. The listing from the station data supplied on punch cards to international organizations has been machine sorted into chronological order for each month of the year.

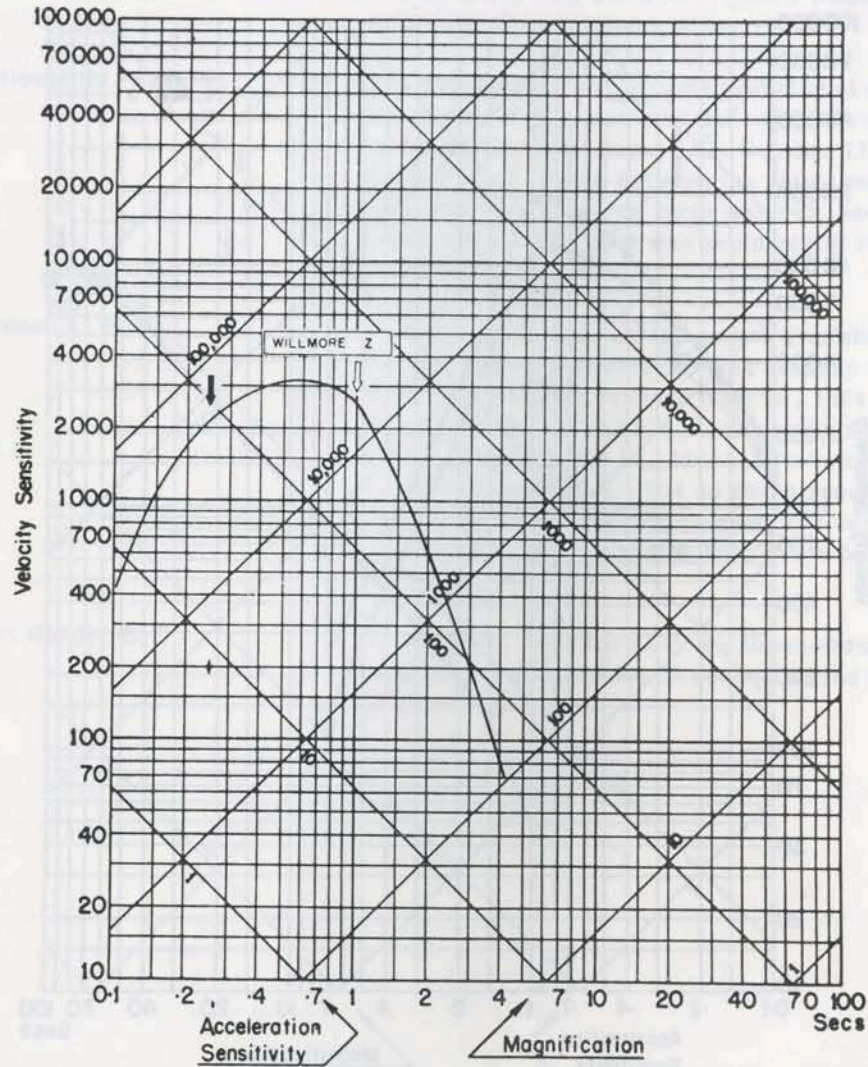

Mr. R. J. Halliday continued as engineer-in-charge of quality control of the seismic network and Mr. F. Lombardo as the senior technical officer for station maintenance, calibration and installation. Dr. F. Kollar was in charge of the central seismological laboratory in Ottawa supporting and servicing the network.

Kenneth Whitham
Chief, Division of Seismology

NOTES FOR 1964

1. Frobisher, N.W.T. From August 8, 1963, until August 24, 1964 the polarities of the L.P.Z. and L.P.E.W. seismographs were reversed. After August 24, 1964 all polarities were standard.
2. London, Ontario On Oct. 6, 1964 a new S.P.E.W. galvanometer was installed. Thereafter the calibration of this seismograph is an estimated one only.
3. Montreal, Quebec On February 11, 12 and 13, 1964 the L.P. seismographs were calibrated, the seismometers set to 30-second-period operation and the systems recalibrated. On September 29, 1964 a temperature compensator was installed on the L.P.Z. seismometer.
4. Mould Bay, N.W.T. Between April 14 and April 26, 1964 the L.P. seismometer periods were checked and reset to the original calibration values.
5. Ottawa, Ontario On February 6 and 7, the L.P. E.W. and L.P. N.S. seismographs were calibrated for 30-second seismometer period standard operation.
6. Saint John's, Nfld. The station was fully operational on June 1, 1964. The calibration curves show the standard nature of the installation.
7. Scarborough, Ont. This station is primarily operated as a training school and no records or readings exist for June and July 1964, the first ten days of August and from December 7 to December 31, 1964.
8. Schefferville, Quebec From December, 1963 until August 24, 1964, the polarity of the L.P. N.S. seismograph was reversed. After August 24, 1964 all polarities were standard.
9. Sept-Iles, Quebec The calibration curve dated January 29, 1963 was obtained at Ottawa. On March 11, 1964 the galvanometer was replaced and the curve dated March 11, 1964 is an estimated plot only. On September 28, 1964 a new S.P.Z. galvanometer was again installed.

CANADIAN EARTHQUAKES - 1964

INTRODUCTION

The general program of the Seismological Service to catalogue all Canadian earthquakes as outlined by Milne and Smith in "Canadian Earthquakes - 1960" (1960-2 of this series) has been completed to the end of 1964. The results have appeared as eight catalogues in the Publications of the Dominion Observatory. The previous work comprises the References at the end of the text -- except for Milne and Davenport (1968 and In press) and Smith (1967). The catalogues are considered final but the data in this series will be incorporated in more formal papers in the Publications at intervals dictated by the seismic activity.

In previous issues of this series (Milne and Smith, 1963 and 1966), the authors described the concept of seismic regionalization and the existence of a departmental committee on this subject. Membership on the committee has been extended to include still other disciplines and it is now known as the Departmental Committee on Recent Crustal Movements and Seismic Regionalization. It was realized that seismic regionalization could not be accomplished in the immediate future as much of the work is essentially long term. However, Milne, who has been studying seismic risk in Canada for some years, has developed a computer program in collaboration with Davenport, which applies the extreme value theorem of statistics to the known seismic history and computes the acceleration corresponding to a given return period (R) at any selected site in eastern or western Canada -- that is the acceleration with an average annual probability of $1/R$ that it will be exceeded. By calculating such accelerations at equally spaced sites in eastern and western Canada and contouring them, in co-operation with personnel of the National Research Council, they have produced seismic zoning maps of both areas (Milne and Davenport, 1968 and In press). These maps were adopted by the National Committee on Earthquake Engineering as the basis for the areal distribution of a seismic design recommended in a revision of the National Building Code for Canada to be published in 1970.

For the purpose of earthquake listings, Canada has been arbitrarily divided into four regions. The most northerly is the Arctic region, consisting of that part of Canada north of the 60th parallel. The area south of the 60th parallel is divided into three regions, a Western region lying west of the 113th meridian, an Eastern region lying east of the 85th meridian, and a Central region lying between the 85th and the 113th meridians.

The earthquakes of the Eastern, Arctic and Western regions are given in Tables I, II and III, and the epicentres are plotted in Figures 1, 3 and 4. In each of these maps the symbol representing an earthquake is related to its magnitude as indicated by a diagram in the legend. During 1964 there was only one earthquake in the Central region. The data are as follows:

Dec. 13 13:48:28 $59^{\circ}00' (\pm 0^{\circ}30')$ N $112^{\circ}15' (\pm 1^{\circ}30')$ W M = 3.7
50 miles west of Fort Chipewyan, Alta.

It is plotted in Figure 3 with the Arctic epicentres.

As reported in the *Canadian Geophysical Bulletin 1967*, Canadian earthquake data are being stored on punch cards. Accordingly, the tables herein were produced from computer printout by photo-offset. It must not be construed that any of the results were computed--rather they were obtained by graphical methods as described by Milne and Lucas (1961) and Smith (1967). Where epicentral determinations are ascribed to other organizations such as the United States Coast and Geodetic Survey (USCGS) or the International Seismological Centre (ISS), unified magnitudes (m) are given; otherwise magnitudes are on the local earthquake magnitude scale (M_L).

NETWORK CHANGES

Detailed notes regarding changes in instrumental constants, calibrations, etc., can be found in the *Seismological Bulletins* (1964-1 of this series). Standard instruments began operation at the stations listed below on the dates given:

St. John's, Nfld.	June 1
Yellowknife, N.W.T.	July 15

EASTERN REGION (East of 85°W between 40°N and 60°N)

Thirty-seven seismic disturbances, including two known rock-bursts and one large blast, originated in this region during 1964. Four of the earthquakes were reported felt. One of these, centred near Deep River, Ontario, was felt at intensity V, on the Modified Mercalli Scale, near the epicentre and less severely over a radius of 200 miles. Questionnaires were distributed and the results are shown in Figure 2. All but four of the 34 earthquakes were located and their epicentres are plotted in Figure 1. The largest, in Pennsylvania, had a magnitude of 5.2.

All the disturbances are listed in Table 1 in the usual format: date, time latitude and longitude, each followed by its uncertainties in brackets, depth if known, and magnitude. Unfortunately, the signs for degree, minute and plus or minus had to be omitted in the printout and the practice of inserting notes made the use of tabular headings impractical. It should be clearly understood that the uncertainties are not 'probable errors' or any other statistical evaluations. They were assigned by the author (Smith) after consideration of the number and quality of the seismic traces, the positions of the epicentres relative to the recording stations, etc., and are an indication of his confidence in the precision of the determinations. When both uncertainties in the co-ordinates are judged to amount to less than $\pm 20'$ of arc, the epicentre is plotted in Figure 1 as a filled circle; otherwise the circle is left open. No serial numbers have, as yet, been assigned.

The following international code letters for seismograph stations have been used as abbreviations in Table I:

LND	London, Ontario	STJ	St. John's, Nfld.
-----	-----------------	-----	-------------------

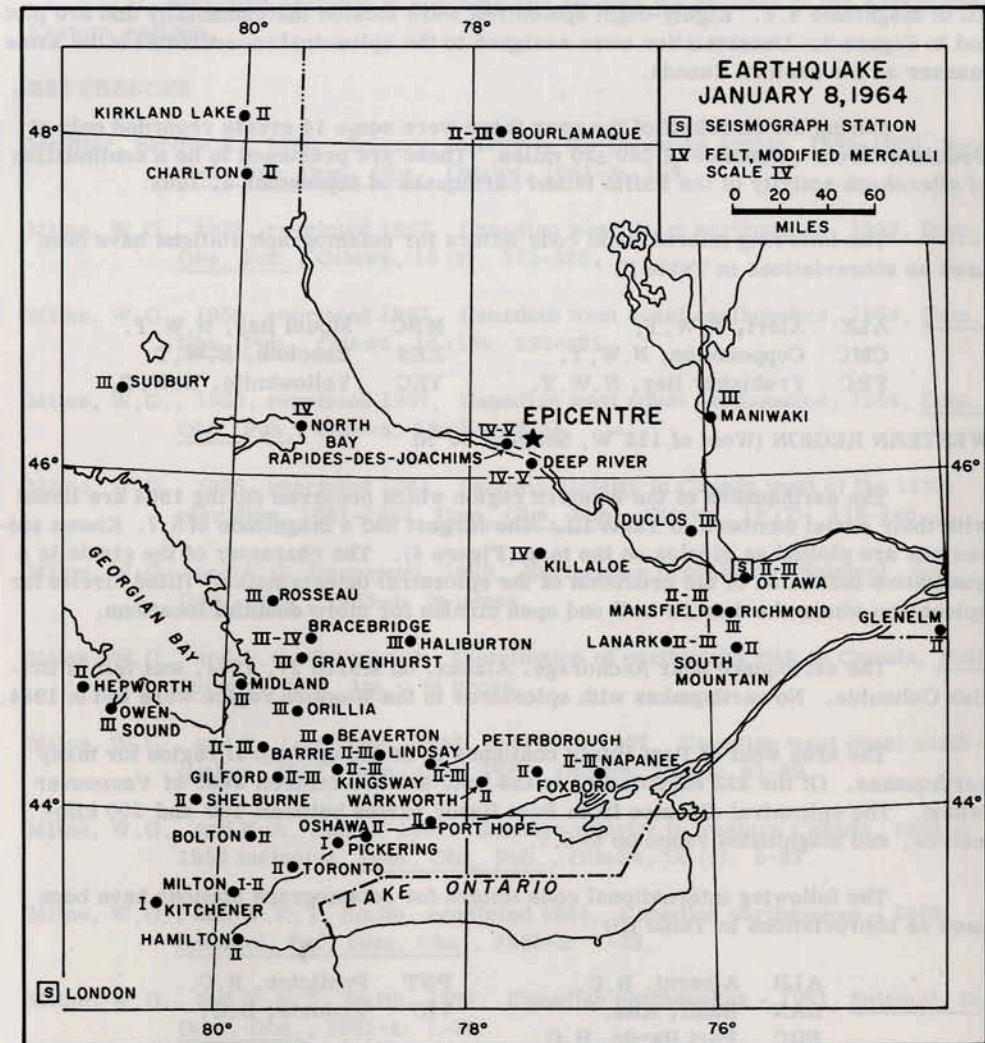

Figure 2

ARCTIC REGION (North of 60°N)

One hundred and fifty-six disturbances were recorded in the Arctic region during 1964. They are listed in Table II without serial numbers. The four largest were

all of magnitude 4.6. Eighty-eight epicentres were located instrumentally and are plotted in Figure 3. Uncertainties were assigned to the epicentral co-ordinates in the same manner as for eastern Canada.

During the first half of the year there were some 14 events recorded only at Frobisher from a distance of 500 ± 20 miles. These are presumed to be a continuation of aftershock activity of the Baffin Island earthquake of September 4, 1963.

The following international code letters for seismograph stations have been used as abbreviations in Table II:

ALE	Alert, N.W.T.	MBC	Mould Bay, N.W.T.
CMC	Coppermine, N.W.T.	RES	Resolute, N.W.T.
FBC	Frobisher Bay, N.W.T.	YKC	Yellowknife, N.W.T.

WESTERN REGION (West of 113°W , South of 60°N)

The earthquakes of the Western region which occurred during 1964 are listed with their serial numbers in Table III. The largest had a magnitude of 5.7. Known epicentres are plotted as circles on the map (Figure 4). The character of the circle is a qualitative indication of the precision of the epicentral determination: filled circles for epicentres where the data fit well and open circles for more doubtful locations.

The earthquake near Anchorage, Alaska, on March 27, 1964, was felt in British Columbia. No earthquakes with epicentres in the Western region were felt in 1964.

The area west of Port Hardy continues to be the epicentral region for many earthquakes. Of the 233 earthquakes in the list, 111 are centred west of Vancouver Island. The epicentral distance from Port Hardy varies between 100 and 200 kilometres, and magnitudes range up to 5.7.

The following international code letters for seismograph stations have been used as abbreviations in Table III:

ALB	Alberni, B.C.	PNT	Penticton, B.C.
BAN	Banff, Alta.	VIC	Victoria, B.C.
PHC	Port Hardy, B.C.		

ACKNOWLEDGMENTS

The co-operation of Rev. M. Buist, S.J., of Jean-de-Brébeuf College in supplying records from the Montreal station on a routine basis is gratefully acknowledged.

During 1964, Weston Observatory published a weekly bulletin identifying the local seismic events recorded on the New England seismic network. This bulletin was very helpful in the task of eliminating extraneous events from the earthquake list for the eastern region.

D. Schieman assisted in scanning and reading the records of the Arctic and Eastern regions.
