SEISMOLOGISCHER JAHRESBERICHT
SEISMOLOGICAL BULLETIN

1968

Erlangen 1969

Vorbemerkungen

Im Jahre 1968 wurde damit begonnen, im Rahmen des internationalen Seismischen Dienstes von allen am Seismologischen Observatorium Gräfenberg registrierten seismischen Ereignissen die Auswertungen der ersten Einsätze den Datenzentren des U.S. Coast and Geodetic Survey (USCGS) in Washington und des Bureau Central International de Sismologie (BCIS) in Straßburg zu melden. Die Daten für den USCGS werden fernschriftlich dem Deutschen Wetterdienst in Offenbach übermittelt und von dort über eine Fernmelde-Schnellverbindung für den Austausch meteorologischer Daten nach den USA weitergeleitet. Das Datenmaterial soll, in Lochkarten zusammengefaßt, auch dem International Seismological Research Centre in Edinburgh zur Verfügung gestellt werden.

Die routinemäßige seismologische Auswertung des Datenmaterials und dessen Bearbeitung für den vorliegenden Jahresbericht wurde von Herrn Dipl.-Phys. H. Aichele ausgeführt.

Erlangen, August 1969

Angaben über das Observatorium

Anschrift: Seismologisches Observatorium
 852 Erlangen
 Nägelsbachstr. 54
 Deutschland (BR)

Telefon: Büro Erlangen 09131-35702
 Meßstation Haidhof
 (Gräfenberg) 09197-329

Telex: 6 29706 grf d

Internationale Kennung: GRF

Leiter: Dr. J. Koppitz
wiss. Mitarbeiter: Dipl.-Phys. H. Aichele
 Dr. P. Ipsen
Techniker: B. Steigner (Feldleiter)
 R. Dörr
 K. Völkel

Die Meßstation liegt auf der Hochfläche der Fränkischen Alb (Abb).

Geographische Koordinaten: $\varphi = 49^{\circ}41'32''\text{N}$
 $\lambda = 11^{\circ}12'55''\text{E}$

Höhe über NN: h = 525 m

Gauß-Krüger-Koordinaten: H = 5.50633 (Hauptmeridian 12°)
 R = 4.44340

(alle Angaben beziehen sich auf den Kreuzungspunkt des Arrays, Abb).

Geologischer Untergrund: Kalke und Dolomite des Weißjura mit einer dünnen lehmigen und sandigen Überdeckung.

Instrumentierung:

Kreuzförmiges Array mit kurzperiodischen Vertikal-Seismometern und einem kurzperiodischen 3-Komponenten-Satz im Array-Kreuzungspunkt vom Typ Benioff und einem langperiodischen 3-Komponenten-Satz vom Typ Sprengnether. Die Seismometer sind über Widerstands-T-Glieder mit Galvanometern von Photozellenverstärkern verbunden, die die Signale für die verschiedenen Registriergeräte liefern.

Registrierarten:
1. Photographisch

- auf 16-mm-Film alle kurzperiodischen Kanäle
 (eine 50 m lange Rolle je Tag),
- auf 35-mm-Film einzeln die Kanäle der kurz- und langperiodischen 3-Komponenten-Anordnungen (für jedes Seismometer ein 90 cm langer Film je Tag).

2. auf **thermosensitivem Papier**
mit Registrierschreiber Helicorder (Geotech Model 2484)
2 Kanäle (im allgemeinen SZ3 und LZ) als Monitor-Sichtregistrierung (ein Blatt 30x90 cm je Tag; R = 15 mm/Min)
3. auf **Magnetband**
0,5"-Band, sieben Kanäle frequenzmoduliert nach IRIG-Norm
die kurz- und langperiodischen 3-Komponenten-Systeme (eine
10,5"-Spule mit ca 1000 m Band in fünf Tagen; R = 143 mm/min
 $\lambda = 15/160$ ips)

Zeitdienst:

Die Zeitmarken des von einer Quarzuhr gesteuerten Zeitmarkengebers werden täglich mit den Zeitzeichen eines Zeitmarkensenders verglichen. Die Quarzuhr wird in solchen Intervallen nachreguliert, daß der Zeitfehler nie 50 ms überschreitet.

Zeitmarkenprogramm:

| | |
|--|-------------------|
| alle 10 s mit Ausnahme der vollen Minute | ein 125-ms-Impuls |
| alle 5 min zur vollen Minute | ein 500-ms-Impuls |
| alle 30 min zur vollen Minute | ein 1-s-Impuls |
| alle h zur vollen Minute | zwei 1-s-Impulse |

Zu Beginn und Ende der täglichen Registrierung wird durch eine zusätzliche Impulsfolge im Morse-Kodex die jeweilige den Zeitmarken zuzuordnende Stunde und Minute in GMT angegeben. Auf dem 16-mm-Film werden von einem gesonderten Zeitgeber der laufende Tag (1-366) und Stunde und Minute in GMT im Klartext eingeblitzt.

Erläuterungen zu den im Seismologischen Bericht aufgeführten Daten

Die Spalten enthalten (von links nach rechts):

1. Tag des Monats
2. Von den Seismogrammen abgelesene Einsatz-Zeit in GMT
3. Richtung der ersten Bodenbewegung
Auf den Seismogrammen wird ein Ausschlag nach oben (Anschlagsrichtung der Zeitmarken) als positiv bezeichnet. Den Ausschlägen auf den Seismogrammen entsprechen bei den Seismometer-Komponenten Z, R und T die Bodenbewegungen in folgender Weise (Abb):

| | | | | | |
|---|-------|--|---------------|---|-------------|
| | Z | | R | | T |
| + | ↑ auf | | + ↑ 140°(↘SE) | + | ↑ 230°(↘SW) |
| - | ↓ ab | | - ↓ 320°(↘NW) | - | ↓ 50°(↘NE) |

Bewertung des Einsatzes

e = allmählicher Einsatz (emersio)
i = scharfer Einsatz (impetus)

Kennzeichnung der Phase

4. Bezeichnung der Seismometer (Abb)
5. Periode des Einsatzes in (s)
6. Doppelamplitude des Einsatzes auf dem Seismogramm in (mm)
7. Herdparameter und Bemerkungen:
Die Angaben zu allen identifizierten Ereignissen entstammen den vom USCGS und vom BCIS herausgegebenen vorläufigen Epizentrenbestimmungen (USCGS = x; BCIS = xx). In vereinzelt Fällen werden diese Angaben durch Daten aus Stationsbulletins ergänzt unter Hinzufügung der internationalen Kennung der betreffenden Station (z.B. STU = Stuttgart).
Die Herdtiefe (= h) wird vom USCGS mit einem nachfolgenden R an-

gegeben, wenn der Wert nicht wie gewöhnlich mit dem Hypozenter-Rechenprogramm bestimmt, sondern in diesem als vorbestimmter Wert verwendet wurde.

Die Epizentralentfernung D wurde aus den übernommenen geographischen Herd-Koordinaten mit einer Korrektur für geozentrische Koordinaten berechnet.

Die Magnitudenangaben sind getrennt aufgeführt nach Bestimmungen aus Raumwellen (MB) und Bestimmungen aus Oberflächenwellen (MS); hinter dem Wert der Magnitude ist in Klammern die nähere Bestimmungsart (PV, PH, SV, SH, LV, LH) und die Kennung der Station aufgeführt, von der der betreffende Wert angegeben wird. Mit M sind alle Magnituden bezeichnet, für die keine näheren Angaben zu ihrer Bestimmung vorliegen.

Introduction

In 1968 it was started to report the results of first arrival analysis of all seismic events recorded at the Gräfenberg observatory to the Data Centers of the U.S. Coast and Geodetic Survey (USCGS) in Washington and the Bureau Central International de Séismologie (BCIS) in Strasbourg. The data for the USCGS are transmitted to the German weather service (Deutscher Wetterdienst) in Offenbach by telex and are forwarded from there to the USA by a high-speed data link which is in use for the exchange of meteorological data. It is intended to forward the data in a file of punched cards to the International Seismological Research Centre in Edinburgh for further processing.

The routine work of analysing the data material and its compiling for this bulletin was done by Dipl.Phys. H. Aichele.

Erlangen, August 1969

J. Kowitz

Observatory Description

| | |
|--|---|
| Address: | Seismologisches Observatorium 852 ERLANGEN Nägelsbachstr. 54 West-Germany (FR) |
| Observatory Manager: | Dr. J. Kowitz |
| Scientific collaborators: | Dipl.Phys. H. Aichele Dr. P. Ipsen |
| Technicians: | B. Steigner (leader of field team) R. Dörr K. Völkel |
| The station is located on the upland plateau of the Fränkische Alb (fig.). | |
| Geographic coordinates: | $\varphi = 49^{\circ}41'32''\text{N}$ $\lambda = 11^{\circ}12'55''\text{E}$ |
| Elevation above sea level: | $h = 525 \text{ m}$ (data of the array cross-point) |
| Geology: | Chalk and dolomite of Jurassic age with a covering of thin sandy loam |

Instrumentation:

Crossed array with short-period vertical Benioff-seismometers and one short-period 3-component set Benioffs in the array crosspoint and a long-period Sprengnether-seismometer 3-component set. The seismometer signals are routed through a bridged-T attenuator to galvanometers of phototube amplifiers which provide the signals for the diverse recording equipment.

Recording:

- optical (fig.)
 - on 16-mm film all short-period channels (one roll of 50 m per day);
 - on 35-mm film separate the channels of the short-period and long-period 3-component sets (for each seismometer one film of 90 cm per day).
- on thermosensitive paper
 - with Helicorder (Geotech Model 2484) two channels (in general SZ3 and LZ) for monitoring (one sheet of 30 x 90 cm per day).
- on magnetic tape
 - .5-inch tape, 7 channels frequency modulated according to IRIG standard; the short- and long-period 3-component systems (one 10.5-inch roll with approx. 1000 m of tape within five days;
 - $R = 143 \text{ mm} / \text{min} = 15/160 \text{ ips}$).

Timing:

The time marks of the programmer which is controlled by a quartz clock are daily compared with time signals received from a time signal broadcasting station. The quartz clock is adjusted in such intervals that the time correction remains less than 50 ms.

Program of time marks:

| | | |
|-------------------|--------------------|------------------|
| every 10 s except | on the full minute | one 125-ms pulse |
| every 5 min | on the full minute | one 500-ms pulse |
| every 30 min | on the full minute | one 1-s pulse |
| every hour | on the full minute | two 1-s pulses |

At the begin and at the end of the daily recording hour and minute in GMT corresponding with respective time marks are indicated by an additional sequence of pulses in Morse code.

Interpretation of Bulletin Columns

The columns of this bulletin are to be read (from left to right):

1. Day of the month
2. Arrival time from the seismograms in GMT
3. a) Direction of first motion
An upward deflection on the seismograms (deflection of the time marks) is defined as positive. The seismogram deflections correspond with the earth motions at the seismometer components Z, R, T as follows:

$$\begin{array}{ccc}
 \begin{array}{c} Z \\ + \uparrow \text{ up} \\ - \downarrow \text{ down} \end{array} &
 \begin{array}{c} R \\ + \uparrow 140^\circ \text{ (SE)} \\ - \downarrow 320^\circ \text{ (NW)} \end{array} &
 \begin{array}{c} T \\ + \uparrow 230^\circ \text{ (SW)} \\ - \downarrow 50^\circ \text{ (NE)} \end{array}
 \end{array}$$

- b) Estimation of phase motion
 - e = gradual beginning of phase motion (emersion)
 - i = sharp beginning of phase motion (impetus)
- c) Designation of the phase type
4. Designation of the seismometer (fig)
5. Period of the first cycle of the phase in seconds
6. Double amplitude on the seismogram of the first cycle of the phase in mm
7. Epicenter data and remarks
All data for the identified events are quoted from the preliminary epicenter determinations reported by the U.S.C.G.S and B.C.I.S. (U.S.C.G.S. = x; B.C.I.S. = xx). In some particular cases these data are supplemented by quotations from station bulletins, in this case the international abbreviation of the reporting station is added for reference (ex. STU = Stuttgart.
The distance D from the epicenter to the GRF-station is calculated from the quoted geographic coordinates of the epicenter with correction for geocentric coordinates.
According to U.S.C.G.S. the notation R following the depth h of the hypocenter indicates that this value is not calculated by the computer program as normally, but that the computation is restrained to this value.
The magnitude values are quoted separately for determinations from body waves (MB) and surface waves (MS); after the magnitude value are noted the phases used for the determination (PV, PH, SV, SH, LV, LH) and the abbreviation of the reporting station. Magnitudes reported without notation concerning their determination are designated with M.

Each symbol on this map represents the epicenter of one or more earthquakes at a specific location. In the case of multiple earthquakes in highly active areas only one symbol is plotted. Consequently, 2,172 symbols are plotted, representing a total of 5,695 epicenters.
