

Original bulletins of the International Seismological Summary (ISS) have been obtained thanks to funding provided by the US National Science Foundation through grant EAR-9725140 (Villaseñor et al., 1997) and have been scanned and collected by SGA Storia Geofisica Ambiente (Bologna) thanks to funding provided by the Istituto Nazionale di Geofisica e Vulcanologia (Rome), in the frame of the EUROSEISMOS project.

These data are considered public domain and may be freely distributed or copied for non-profit purposes provided the previous references are quoted.

The International Seismological Summary for 1921 January, February, March.

FORMERLY THE BULLETIN OF THE
BRITISH ASSOCIATION SEISMOLOGY COMMITTEE.

The present number opens the fourth year of the Summary in its international form. The work of identifying the epicentres and times has been largely that of Mr. J. S. Hughes, B.A., of New College, Oxford, whose salary has been provided partly by the generosity of Dr. J. E. Crombie, of Dyce, Aberdeen, and partly by the Board of Scientific and Industrial Research, but in the present number considerable volunteer help was given by the Rev. Joseph Lynch, S.J., of Fordham University, New York, which is here gratefully acknowledged. The careful and orderly arrangement of readings from the various (and by this time numerous) observatories has been the work of Miss E. F. Bellamy. Much of the routine calculation was done by the late Mr. S. Dolman, who died nearly a year ago, and has not yet been replaced.

Those who were associated with this work before it had developed into the present International Summary will learn with deep regret of the death of Mr. Howard Burgess, who helped Professor Milne, at first with the printing of results (for he was a printer on his own account in Newport, Isle of Wight, of which Milne's home, Shide, was a suburb), and later in all details of the work; which he also carried on, under comparatively slight superintendence from West Bromwich and Oxford, for some years after Milne's death, until war conditions made continuance impossible. Before he left Newport he had become associated with the Isle of Wight County Press, and took with him the seismological printing. It will be seen from the imprints that this arrangement still continues to our satisfaction. The funds for printing are provided by the International Union of Geodesy and Geophysics.

The work started by Milne was transferred to Oxford, when Mrs. Milne returned to Japan in 1919, and the house and observatory were consequently sold. At the moment of writing they are apparently again in the market.

Original bulletins of the International Seismological Summary (ISS) have been obtained thanks to funding provided by the US National Science Foundation through grant EAR-9725140 (Villaseñor et al., 1997) and have been scanned and collected by SGA Storia Geofisica Ambiente (Bologna) thanks to funding provided by the Istituto Nazionale di Geofisica e Vulcanologia (Rome), in the frame of the EUROSEISMOS project.

These data are considered public domain and may be freely distributed or copied for non-profit purposes provided the previous references are quoted.

2

The present number of the Summary deals with 61 epicentres, 31 of which are new and 30 are repetitions from old epicentres. There are five cases of abnormal focus, all in March :

Date. d. h.	Epicentre.	Focus.
Mar. 4 12	29°N. 139°E.	+ .060
Mar. 6 7	26.5°N. 109°W.	- .020
Mar. 23 22	5.5°S. 130°E.	+ .060 ?
Mar. 24 1	5.5°S. 130°E.	+ .060 ?
Mar. 30 15	7.6°S. 128.8°E.	+ .040

The sign + means below normal, - above. The unit is the earth's radius.

Attention may also be called to the small Japanese shock on Jan. 9d. 18h. It seems possible that it reached La Paz in the form of [P], though intermediate readings fail, except L for De Bilt. If so the large residual (-61s.) indicates a very deep focus, which there are no other means of checking. Other cases have been noticed where [P] waves seem to be received near the antipodes of the epicentre, though not much is noticed at intermediate stations. The point seems worthy of special attention.

At the Madrid meeting of the International Union it was suggested that "where possible it should be noted whether a wave was condensational or dilatational, by adding the letter C or D to the readings" (see Introd. to Summary for 1920 July, Aug., Sept., p. 101). But such cases are apparently rare: None were found in the readings of De Bilt, Strasbourg, and Uccle for the months treated below. Enquiry is being made as to a possible misunderstanding.

The name of the Observatory at Vieques was changed in August 1920 to Porto Rico Observatory; and this change has been followed in the Summary.

H. H. TURNER.

University Observatory, Oxford.
1925 March 25.

P.S.—A few days after sending the above to press a letter was received from Mr. Jodo Horikawa from Hakodate, dated Feb. 17, giving the news that his aunt, Mrs. Milne, died at Hakodate on Jan. 30, after a long illness.

Original bulletins of the International Seismological Summary (ISS) have been obtained thanks to funding provided by the US National Science Foundation through grant EAR-9725140 (Villaseñor et al., 1997) and have been scanned and collected by SGA Storia Geofisica Ambiente (Bologna) thanks to funding provided by the Istituto Nazionale di Geofisica e Vulcanologia (Rome), in the frame of the EUROSEISMOS project.

These data are considered public domain and may be freely distributed or copied for non-profit purposes provided the previous references are quoted.

1921. Jan. 7d. 2h. 51m. 11s. Epicentre 53°0S. 140°0E.

$$A = -461, B = +387, C = -799; D = +643, E = +766; G = +612, H = -514, K = -602.$$

(Epicentre 48°0S. 134°0E. of 1919 Mar. 4d. was tried. It satisfied Sydney, Riverview, Christchurch, and Manila fairly well, but was wide of the mark in all other cases, particularly in the case of Adelaide, Perth, and Batavia).

28

Feb. 27d. Readings also at 0h. (Apia), 2h. (La Paz), 8h. (Manila), 20h. (Taihoku), 21h. (La Paz).

Feb. 28d. Readings at 2h. (Apia and near Tacubaya), 3h. (Manila), 9h. (Taihoku and near Tokyo), 11h. (Helwan), 13h. (La Paz), 15h. (Riverview), 16h. (Lick and Helwan and near Tacubaya (2)), 21h. (Lick).

Mar. 1d. 6h. 36m. 52s. Epicentre $0^{\circ}0.135^{\circ}$ E. (as on 1919 Nov. 23d.).

$$A = -707, B = +707, C = -000; D = +707, E = +707; G = -000, H = -000, K = -1.000.$$

Very doubtful. The Riverview L and M suggest that the epicentre is much nearer Riverview so that the reading +7m.50s. really belongs to S. But this is inconsistent with the readings for Manila and Batavia, unless we assume a very deep focus, which is not supported by the La Paz observation.

Additional readings: Manila gives MN = +9.8m. Adelaide iS = +12m.12s., SR₁ = +14m.24s., SR₂ = +15m.0s., SR₃ = +15m.18s. Riverview MN = +18.7m., MZ = +23.6m. De Bilt MN = +77.1m. Epicentre 7°.1S. 128°.8E. Chicago SR₁ is given as eL.

NOTE: This solution was the best that could be attained, after some work, from the consideration of the above material alone. But the following shock for which an independent solution gives another epicentre, has much in common with this, as direct comparison shows. On combining the two the mean residuals suggested that the epicentre should be nearer Australia, and also nearer Manila in an approximately opposite azimuth (which indicates deep focus); further that it should be more to the East. Now there is an epicentre 5°.5S. 130°.0E., for which on 1920 May 10 the observations suggested a deep focus, viz. 0.060. This depth seems rather large for the present observations, but it was decided to give, as alternative, a solution with the same epicentre and depth of focus as below.

SECOND SOLUTION.

Mar. 23d. 22h. 44m. 50s. Epicentre 5°.5S. 130°.0E. (as on 1920 May 10d.).

$$A = -640, B = +763, C = -96.$$

Depth of focus 0.060.

Colombo	53.2	284	16 48	?S	(16 48)	-11	30.8	37.8
Kodaikanal	56.4	289	25 36	?L	—	—	29.9	32.8
Victoria	104.9	40	—	—	—	—	—	57.7
Uccle	117.8	325	—	—	—	—	e 59.8	—
De Bilt	116.8	326	—	—	—	—	e 56.8	61.6
Moncalieri	118.1	318	—	—	—	—	e 69.1	—
Stonyhurst	119.8	330	—	—	—	—	—	68.8
Chicago	130.6	37	—	—	—	—	e 65.8	—
La Paz	149.8	140	i 20 40	[+44]	—	—	77.3	—

Additional readings : Manila gives MN = +9.9m. Adelaide SR₁ = +14m.36s. SR₂ = +15m.24s. SR₃ = +15m.39s. Riverview MN = +22.6m. MZ = +22.1m. Melbourne PR₁ = +7m.36s. SR₁ = +14m.42s. De Bilt MN = +75.5m. Epicentre $6^{\circ}55'S.$ $130^{\circ}56'E.$

NOTE : The above solution represents the best that could be done from the study of the above material alone. But as already stated in the note to the previous earthquake, direct comparison suggested that the two might be from the same focus ; and on combining them, further discussion suggested similarity with the conditions of 1920 May 10 : viz., a focus 0.060 radius below normal, and a position $5^{\circ}55'S.$ $130^{\circ}0'E.$ for the epicentre. The following solution is therefore given with these elements, though the depth 0.060 is perhaps excessive for the present shock :—

SECOND SOLUTION.

Mar. 24d. 1h. 26m. 0s. Epicentre $5^{\circ}55'S.$ $130^{\circ}0'E.$ (as on Mar. 23d.).

$$A = -640, B = +763, C = -096.$$

A focal depth 0.060 below normal is assumed as on 1920 May 10.

Additional Readings.

JANUARY.

30d. 0h. (Belgrade), 7d. 0h. (Belgrade), 8d. 2h. (Mostar and Sarajevo), 15d. 10h. (Belgrade and Sarajevo), 22d. 9h. and 12h. (Belgrade), 30d. 13h. (Belgrade).

FEBRUARY.

1d. 22h. (Sarajevo), 6d. 5h. (Belgrade), 6d. 20h. (Mostar), 8d. 20h. (Belgrade), 9d. 0h. (Belgrade), 10d. 15h. (Belgrade), 17d. 23h. (Mostar), 9d. 20h. (2) and 21h. (Belgrade), 21d. 14h. and 18h. (Belgrade), 22d. 20h. (Belgrade), 25d. 17h. and 18h. (Belgrade), 26d. 13h., 14h., 16h., and 18h. (Belgrade), 27d. 20h. (Belgrade), 28d. 15h. and 17h. (Belgrade).

MARCH.

5d. 16h. (Belgrade), 11d. 22h. (Mostar), 12d. 1h. (Mostar), 20d. 19h. (Sarajevo), 21d. 7h. (Mostar and Sarajevo).

The following additional earthquake is suggested by the belated readings:—

Jan. 8d. 2h. 0m. 30s. Epicentre 44°6N. 13°3E. (as on 1920 June 4d.).

	Δ °	P. m. s.	O-C. s.	S. m. s.	O-C. s.	M. m.
Rocca di Papa	2·9	0 42	- 3	—	—	2·8
Mostar	3·5	0 57	+ 2	1 33	- 4	2·1
Sarajevo	3·7	1 0	+ 2	1 36	- 6	1·9

Observatories are urgently requested to send to Oxford as soon as possible readings for the years 1921 & 1922, so that the lists may be made complete without the need for these supplements.

Original bulletins of the International Seismological Summary (ISS) have been obtained thanks to funding provided by the US National Science Foundation through grant EAR-9725140 (Villaseñor et al., 1997) and have been scanned and collected by SGA Storia Geofisica Ambiente (Bologna) thanks to funding provided by the Istituto Nazionale di Geofisica e Vulcanologia (Rome), in the frame of the EUROSEISMOS project.

These data are considered public domain and may be freely distributed or copied for non-profit purposes provided the previous references are quoted.

48

It has been suggested that it may be convenient to give here the **International Code for Transmission of Seismic Telegrams.**

Four groups of five figures are used . . . thus :—

ddaaap	phhmm	ssddd	D,D,DDD.
dd = day of the month			
aa = azimuth.			
pp = nature of the phases P and S.			
hh = hour	mm = minutes	} in Greenwich mean time for the commencement	
mm = seconds		of the seismogram (P).	
ss = seconds			
ddd = S - P in seconds.			
D,D, = \bar{P} - P , , , for near shocks.			
DDD = distance in kilometres of near shocks.			
D,D,DDD = , , , , , distant shocks.			

Explanations.

aa azimuths. These figures $\times 10$ = degrees from North through East (figures used are 1 to 36). If the azimuth is uncertain to 180° , then 50 is added to the figures in the telegram = 51 to 86. If the estimate of the azimuth is uncertain and one cannot indicate nearer than 45° , each 45° from North through East is indicated by the figures 91 to 98.

99 means not yet determined.

00 , , estimate of azimuth impossible.

pp nature of P and S.

First figure refers to P (1 to 4 used).

- 1 = iP ; very clear.
- 2 = P and \bar{P} both clear.
- 3 = P ; clear but without impetus.
- 4 = eP ; badly defined.

The second figure refers to S (5 to 8 are used).

- 5 = iS, S sharp impetus and very clear.
- 6 = clear.
- 7 = badly defined.
- 8 = S uncertain.

The figure 9 in either place means lost in time mark.

Example. 20991 50051 33393 04830

= 20th of the month, azimuth not yet determined, iP iS. P commencing 0hrs. 51m. 33sec. after midnight. S - P = 393 seconds. Distance 4830 kilometres.
