## **The International Seismological Summary.**

**1952 January, February, March.**

---

INTERNATIONAL GEODETIC AND GEOPHYSICAL UNION.  
ASSOCIATION OF SEISMOLOGY.  
FORMERLY THE BULLETIN OF  
THE BRITISH ASSOCIATION SEISMOLOGY COMMITTEE.

---

The Director of the I.S.S. wishes to express his thanks to U.N.E.S.C.O. and H.M. Treasury for financial support, which has covered the cost and preparation of this volume.

---

This number constitutes the beginning of the sixteenth volume of the International Seismological Summary in which travel times and Epicentral distances are calculated with reference to "Geocentric" latitudes of epicentres and observing stations. The travel-times used in making determinations are those contained in "Seismological Tables" by H. Jeffreys and K. E. Bullen, British Association for Advancement of Science—London, 1958, and residuals derived accordingly. In contrast to previous years the additional readings previously added at the foot of the tabular matter and at the end of each day's data have been omitted. The amount of material has been increasing so rapidly that some selective process is necessary to moderate the rate of expansion of the volume.

Distances are calculated from modified direction-cosines defined by :

$$\begin{aligned}A &= \cos \phi' \cos \lambda \\B &= \cos \phi' \sin \lambda \\C &= \sin \phi'\end{aligned}$$

$\lambda$  being the east longitude from Greenwich and  $\phi'$  the *geocentric* latitude whose relationship to the ordinary *geographic* latitude  $\phi$  is :—

$$\tan \phi' = .99328 \tan \phi.$$

These formulae are used to determined direction-cosines of both epicentre and station, though the position is in every case referred to normal  $\phi$  and  $\lambda$ .

The scanned images of the bulletins of the International Seismological Summary (ISS) have been obtained thanks to funding provided by the US National Science Foundation through grant EAR-9725140 (Villaseñor et al., 1997) and collected by SGA Storia Geofisica Ambiente (Bologna) on behalf of the Istituto Nazionale di Geofisica e Vulcanologia (Rome), in the frame of the EUROSEISMOS project.

These data are considered public domain and may be freely distributed or copied for non-profit purposes provided the previous references are quoted.

## 2

The notation is that generally accepted. P and S stand for the times of onset of the direct longitudinal and transverse waves. Pg, Sg, P\*, S\* for short distances are used for times of these waves transmitted through the superficial "Granitic" and "Intermediate" layers respectively. Reflections of the direct waves at the earth's surface are denoted by PP, PS, PPP, SS . . . and at the outer surface of the central core by PcP, PcS . . .

The refracted longitudinal wave through the central core is known as K. Such waves as PKP, SKS, PKS, SKKS, are frequently recorded at great distances from the epicentre. All times are given as Greenwich Civil Time and are referred to the adopted  $T_0$  as zero.

The arrangement of the "Summary" is as follows :--

(1) Date and Time at Origin ( $T_0$ ), calculated from the above-mentioned tables, together with the depth of focus where this is assumed not to be in the surface. The time calculated is that at which the P wave leaves the focus, not that when P arrives at the epicentre.

(2) Epicentre constants :--

$$\begin{array}{lll} A = \cos \phi' \cos \lambda & D = \sin \lambda & G = \sin \phi' \cos \lambda \\ B = \cos \phi' \sin \lambda & E = -\cos \lambda & H = \sin \phi' \sin \lambda \\ C = \sin \phi' & & K = -\cos \phi' \end{array}$$

from which distances,  $\Delta$ , and where necessary Azimuths, of stations with respect to the epicentre may be calculated by means of the formulae :--

$$\begin{aligned} \cos \Delta &= aA + bB + cC \\ 2 - 2 \cos \Delta &= (a - A)^2 + (b - B)^2 + (c - C)^2 \\ \sin Az. &= -(aD + bE) \operatorname{cosec} \Delta \\ \cos Az. &= -(aG + bH + cK) \operatorname{cosec} \Delta \end{aligned}$$

a, b, c being related to the observing station in the same way as A, B, C are to the epicentre.

$\delta$  is defined as the nearest integer to  $10^5(A^2 + B^2 + C^2 - 1)$  and may be used to compare distances calculated by the first two formulae above, whose equivalence depends on the assumption

$$A^2 + B^2 + C^2 = 1$$

$h$  is the height, in kilometres, of the epicentre above the sphere of equal volume concentric with the earth and is given by

$$h = -3.549 + 10.738 \cos 2\phi$$

The scanned images of the bulletins of the International Seismological Summary (ISS) have been obtained thanks to funding provided by the US National Science Foundation through grant EAR-9725140 (Villaseñor et al., 1997) and collected by SGA Storia Geofisica Ambiente (Bologna) on behalf of the Istituto Nazionale di Geofisica e Vulcanologia (Rome), in the frame of the EUROSEISMOS project.

These data are considered public domain and may be freely distributed or copied for non-profit purposes provided the previous references are quoted.

3

- (3) The tabular matter consisting of the station names arranged in order of epicentral distances, followed by this distance and the Azimuth measured round the epicentre from North through East. Other columns give the P phase and its residual, or PKP, in which the residual is shown in brackets [ ]. The S phase or an associated phase follows with its residual. If SKS is entered here the residual is shown in [ ], and if SKKS in { }. Phases considered as belonging to P\*, Pg, S\*, Sg are indicated by the appropriate symbol being placed against the figure in P or S residual column. Under "Supp" is placed the time of some other, preferably well recorded, phase such as PS, SS, or, in the case of deep focus shocks, pP. The final column, L, records the onset, if known, of Rayleigh waves R, or of the horizontally polarised surface waves Q.

The letters E, N, Z after a phase indicate that the reading was taken on an instrument recording East-West, North-South, or Vertical component of motion, though some stations have instruments oriented to record North-East or North-West components. Reflections near the epicentre take place, and in the case of deep focus earthquakes can be distinguished from the direct phases. These are shown as pP, sS, sP, pPP—the small p and s referring to the initial portion of the path towards the surface.

The letters a, k after a P or PKP phase stand for the terms "Anaseismic" and "Kataseismic," and indicate whether the first longitudinal motion was one away from the focus or towards it.

The epicentres for earthquakes with abnormal focal depth are calculated from travel times appropriate to them in the tables cited above. The depth to be assumed can be obtained from these tables when the observational data are plentiful, and the epicentre then determined in the usual way. When the data are scanty an indication of depth can be obtained from the evidence of the readings of certain individual stations.

The first quarter of 1952 contains 314 epicentres, 240 of which are repetitions from previous epicentres. 113 have been attributed to abnormal focal depth.

Thanks are also due to the Director of the Meteorological Office and the Superintendent of Kew Observatory for hospitality extended to the staff and assistance with administration.

KEW OBSERVATORY,  
Richmond,  
SURREY.

January, 1960.

Jan. 31d. 20h. 55m. 12s. Epicentre 4°-0S. 29°-6E.

Felt strongly at Entebbe (Uganda); slight damage in the Kigoma region of Tanganyika; felt less strongly at Kibondo and Nyarwonga (Tanganyika).  
Epicentre 4°-0S. 30°-25E. (Strasbourg).

J. P. Henderson.

March 4d. 1h. 22m. 40s. Epicentre 42°2N. 143°9E.

Much damage and many casualties throughout the South Eastern parts of Hokkaido. Especially serious at Urakawa, Toyokoro, Uraboro, Otsu, Ikeda, and Hamanaka. Hamanaka itself was destroyed by a tsumami which in many places attained a height of one to two metres. On the coast of Kusiro waves of from four to five metres were recorded. 815 houses were destroyed, 1324 partially destroyed, and 6395 damaged. Much of the destruction was by flooding and fire; 91 houses were swept away, and 448 vessels were sunk in harbour.

Intensity IX at Ikeda, Otsu, Azuma, Toyokoro, Makubetsu, and Oonbetsu; VII-VIII at Urakawa, Obihiro, Kusiro, and Akkeshi.

Epicentre as adopted. Depth 35-55km. Macroseismic radius greater than 300km.

Seismo. Bull. Cent. Met. Obs., Japan, for March, 1952, Tokyo, 1952, pp. 68-72, with macroseismic chart.

March 4d. 1h. 40m. 4s. Epicentre 42°·2N. 143°·9E. (as at 1h. 22m.).

Intensity V at Mukawa, Misono, Esasi, and Gamusi; IV at Hatinohe, Aomori, Otaru, Yoiti, Kutchian-Kotohira, and Rusuutsu. Epicentre 42°·0N. 144°·3E.

Macro seismic radius greater than 300km.

Seismological Bulletin of the Cent. Met. Obs., Japan, for March, 1952, Tokyo, 1952, p.72, with macro seismic chart.

March 5d. 9h. 17m. 6s. Epicentre 41°·7N. 144°·9E. (as at 5h.).

Intensity II-III at Kusiro and Urakawa.

Epicentre 41°·8N. 144°·3E. Depth 20km. Macroseismic radius 100-200km.

Seismological Bulletin of the Central Meteorological Observatory, Japan, for March, 1952, Tokyo, 1952, p.87.

March 7d. 9h. 44m. 36s. Epicentre 42°·2N. 143°·9E. (as on 6d.).

Intensity IV at Urakawa, Misono, Erimomisaki, Meguro, Mukawa, and Goshogawara ; II-III at Kusiro, Nemuro, Morioka, and Tomakomai.

Epicentre 41°·8N. 143°·7E. Depth 30km. Macroseismic radius >300km.

Seismo. Bulletin Cent. Met. Obs., Japan, 1952, Tokyo, 1952, p. 103, with macroseismic chart.

1952

201

March 8d. 2h. 1m. 14s. Epicentre 36°·4N. 136°·2E. (as on 7d.).

Intensity V at Hukui; IV at Kanazawa, Maizuru, Obama, Daishoji, Osugi, Shiramine, Unoke, Togi, and Komatu.

Epicentre as adopted. Macroseismic radius 100-200km.

Seismological Bulletin of the Cent. Met. Obs., Japan, for March, 1952, Tokyo, 1952, p.107, with macroseismic chart on page 107.

March 13d. 13h. 57m. 37s. Epicentre 28°·5N. 127°·3E. Depth of focus 0·040.

Intensity IV at Koti; II-III at Kagosima, Yakusima, and Miyazaki.

Epicentre as adopted. Depth 240km. Macroseismic radius >300km.

Seismo. Bull. Cent. Met. Obs., Japan, March, 1952, Tokyo, 1952, p.122, with macroseismic chart.

$$A = -0.5334, B = +0.7002, C = +0.4747; \quad \delta = +14; \quad h = +2;$$

$$D = +0.795, E = +0.606; \quad G = -0.288, H = +0.378, K = -0.880.$$

The scanned images of the bulletins of the International Seismological Summary (ISS) have been obtained as part of a global earthquake relocation project (Villaseñor et al., 1997) initiated with funding from the US National Science Foundation through grant EAR-9725140 and collected by SGA [Storia Geofisica Ambiente](#) (Bologna) on behalf of the [Istituto Nazionale di Geofisica e Vulcanologia](#) (Rome), in the frame of [Euroseismos](#) project.

A digital hypocenter file of the ISS (Villaseñor and Engdahl, 2005) can be obtained from the USGS web site: <http://earthquake.usgs.gov/scitech/iss/>

These data are considered public domain and may be freely distributed or copied for non-profit purposes provided the previous references are quoted.
