## The International Seismological Summary. 1955 January, February, March.

---

INTERNATIONAL GEODETIC AND GEOPHYSICAL UNION.  
ASSOCIATION OF SEISMOLOGY.

---

The Director and Committee of the I.S.S. wish to express their thanks to U.N.E.S.C.O., to the International Association of Seismology and the Physics of the Earth's Interior, to the National Science Foundation of the United States, and to H.M. Treasury for the financial support of this publication.

Further thanks are due to the Director of the Royal Meteorological Office and the Superintendent of Kew Observatory for housing the project and for providing administrative assistance. The United Kingdom Atomic Energy Authority continues to provide the services of an electronic computer, which is making a decisive contribution to the effort of overtaking the arrears of publication.

---

This number constitutes the beginning of the nineteenth volume of the International Seismological Summary in which travel times and epicentral distances are calculated with reference to "Geocentric" latitudes of epicentres and observing stations. The travel times used in making determinations are those contained in "Seismological Tables" by H. Jeffreys and K. E. Bullen, British Association for Advancement of Science—London, 1958, and residuals derived accordingly. In contrast to previous years the additional readings previously added at the foot of the tabular matter and at the end of each day's data have been omitted. The amount of material has been increasing so rapidly that some selective process is necessary to moderate the rate of expansion of the volume.

Distances are calculated from modified direction-cosines defined by :

$$A = \cos \phi' \cos \lambda$$

$$B = \cos \phi' \sin \lambda$$

$$C = \sin \phi'$$

$\lambda$  being the East longitude from Greenwich and  $\phi'$  the *geocentric* latitude whose relationship to the ordinary *geographic* latitude  $\phi$  is :—

$$\tan \phi' = .99328 \tan \phi.$$

These formulae are used to determine direction-cosines of both epicentre and station, though the position is in every case referred to normal  $\phi$  and  $\lambda$ .

The scanned images of the bulletins of the International Seismological Summary (ISS) have been obtained thanks to funding provided by the US National Science Foundation through grant EAR-9725140 (Villaseñor et al., 1997) and collected by SGA Storia Geofisica Ambiente (Bologna) on behalf of the Istituto Nazionale di Geofisica e Vulcanologia (Rome), in the frame of the EUROSEISMOS project.

These data are considered public domain and may be freely distributed or copied for non-profit purposes provided the previous references are quoted.

## 2

The notation is that generally accepted. P and S stand for the times of onset of the direct longitudinal and transverse waves. Pg, Sg, P\*, S\* for short distances are used for times of these waves transmitted through the superficial "Granitic" and "Intermediate" layers respectively. Reflections of the direct waves at the earth's surface are denoted by PP, PS, PPP, SS . . . and at the outer surface of the central core by PcP, PcS . . .

The refracted longitudinal wave through the central core is known as K. Such waves as PKP, SKS, PKS, SKKS, are frequently recorded at great distances from the epicentre. All times are given as Greenwich Civil Time and are referred to the adopted  $T_0$  as zero.

The arrangement of the "Summary" is as follows :—

- (1) Date and Time at Origin ( $T_0$ ), calculated from the above-mentioned tables, together with the depth of focus where this is assumed not to be in the surface. The time calculated is that at which the P wave leaves the focus, not that when P arrives at the epicentre.
- (2) Epicentre constants :—

$$\begin{array}{lll} A = \cos \phi' \cos \lambda & D = \sin \lambda & G = \sin \phi' \cos \lambda \\ B = \cos \phi' \sin \lambda & E = -\cos \lambda & H = \sin \phi' \sin \lambda \\ C = \sin \phi' & & K = -\cos \phi' \end{array}$$

from which distances,  $\Delta$ , and where necessary azimuths, Az., of stations with respect to the epicentre may be calculated by means of the formulae :—

$$\begin{aligned} \cos \Delta &= aA + bB + cC \\ 2 - 2 \cos \Delta &= (a - A)^2 + (b - B)^2 + (c - C)^2 \\ \sin \text{Az.} &= -(aD + bE) \operatorname{cosec} \Delta \\ \cos \text{Az.} &= -(aG + bH + cK) \operatorname{cosec} \Delta \end{aligned}$$

a, b, c being related to the observing station in the same way as A, B, C are to the epicentre.

$\delta$  is defined as the nearest integer to  $10^5(A^2 + B^2 + C^2 - 1)$  and may be used to compare distances calculated by the first two formulae above, whose equivalence depends on the assumption

$$A^2 + B^2 + C^2 = 1$$

$h$  is the height, in kilometres, of the epicentre above the sphere of equal volume concentric with the earth and is given by

$$h = -3.549 + 10.738 \cos 2\phi$$

- (3) The tabular matter consisting of the station names arranged in order of epicentral distances, followed by this distance and the azimuth measured round the epicentre from North through East. Other columns give the P phase and its residual, or PKP, in which

The scanned images of the bulletins of the International Seismological Summary (ISS) have been obtained thanks to funding provided by the US National Science Foundation through grant EAR-9725140 (Villaseñor et al., 1997) and collected by SGA Storia Geofisica Ambiente (Bologna) on behalf of the Istituto Nazionale di Geofisica e Vulcanologia (Rome), in the frame of the EUROSEISMOS project.

These data are considered public domain and may be freely distributed or copied for non-profit purposes provided the previous references are quoted.

### 3

the residual is shown in brackets [ ]. The S phase or an associated phase follows with its residual. If SKS is entered here the residual is shown in [ ], and if SKKS in { }. Phases considered as belonging to P\*, Pg, S\*, Sg are indicated by the appropriate symbol being placed against the figure in P or S residual column. Under "Supp" is placed the time of some other, preferably well recorded, phase such as PS, SS, or, in the case of deep focus shocks, pP. The final column, L, records the onset, if known, of Rayleigh waves R, or of the horizontally polarised surface waves Q.

The letters E, N, Z after a phase indicate that the reading was taken on an instrument recording East-West, North-South, or Vertical component of motion, though some stations have instruments oriented to record North-East or North-West components. Reflections near the epicentre take place, and in the case of deep focus earthquakes can be distinguished from the direct phases. These are shown as pP, sS, sP, pPP—the small p and s referring to the initial portion of the path towards the surface.

The letters a, k after a P or PKP phase stand for the terms "Anaseismic" and "Kataseismic," and indicate whether the first longitudinal motion was one away from the focus or towards it.

The epicentres for earthquakes with abnormal focal depth are calculated from travel times appropriate to them in the tables cited above. The depth to be assumed can be obtained from these tables when the observational data are plentiful, and the epicentre then determined in the usual way. When the data are scanty an indication of depth can be obtained from the evidence of the readings of certain individual stations.

In view of the greatly increased volume of observational data now being supplied to the International Seismological Summary from the many earthquake recording organisations throughout the world, the International Seismological Association decided that some limitation should be imposed on quantity to be printed. With a view to reducing both the expense and time expended on the work, the Association decided at its meeting in Helsinki in August, 1960, that only those earthquakes which appear to be of magnitude six or over should be treated in detail. Exceptions are made occasionally for earthquakes of special interest or from epicentres in unusual areas.

The first quarter of 1955 deals with 106 epicentres, of which 40 have been attributed to abnormal focal depth.

KEW OBSERVATORY,  
RICHMOND,  
SURREY.

April, 1962.

The scanned images of the bulletins of the International Seismological Summary (ISS) have been obtained thanks to funding provided by the US National Science Foundation through grant EAR-9725140 (Villaseñor et al., 1997) and collected by SGA Storia Geofisica Ambiente (Bologna) on behalf of the Istituto Nazionale di Geofisica e Vulcanologia (Rome), in the frame of the EUROSEISMOS project.

Jan. 21d. 15h. 41m. Epicentre 38°·4N. 70°·5E.  
Bull. of the Seismo. Stations of the U.S.S.R. for Jan.-March, 1955, Moscow, 1956, pp. 65-66.

Jan. 21d. 18h. 1m. 15s. Epicentre 36°·4N. 140°·0E. Depth of focus 120-140km.  
Intensity V at Kohu; IV at Tukubasan, Utunomiya, Kakioka, Mito, Kumagaya, Tokyo, Onahama, Titibu, and Kashiwa; II-III at Shirakawa, Maebasi, Yokohama, Tyosi, Hunatu, Ajiro, and Osima.  
Seismo. Bull. Cent. Met. Obs., Japan, for Jan., 1955, Tokyo, 1955, pp. 30-32, with macro-seismic chart.

Jan. 22d. 20h. 39m. Epicentre 38°·7N. 21°·7E. Magnitude 4·75.  
Poorly recorded up to 85°.  
Intensity V at Analipsis, Aetolion, and Agrinon; IV at Patras  
Seismo. Institute Bull. National Observatory of Athens for 1955, Athens, 1956, pp. 20-21.

Jan. 23d. 17h. 56m. Epicentre 40°·3N. 42°·3E.  
*Loc. cit.*, 21d. 15h., p. 38.

Jan. 25d. 8h. 4m. 49s. Epicentre 43°·2N. 146°·2E. Depth about 60km.  
Intensity IV at Nemuro and Kusiro.  
Seismo. Bull. Cent. Met. Obs., Japan, for Jan., 1955, Tokyo, 1955, p. 32, with macro-seismic chart.

Jan. 25d. 14h. 50m. 8s. Epicentre 80°·4N. 2°·1W.

$$A = +\cdot 1677, B = -\cdot 0062, C = +\cdot 9858; \quad \delta = -4; \quad h = -14;$$

$$D = -\cdot 037, E = -\cdot 999; \quad G = +\cdot 985, H = -\cdot 036, K = -\cdot 168.$$

1955

172

March 28d. 14h. 45m. 50s. Epicentre 37°·7N. 21°·2E.

Intensity 5·75. Recorded up to 96°.

Intensity VII at many places on Isle of Elis.

Intensity IV or greater throughout the Ionian Sea and Archipelago. Macroseismic area 60,000 sq. km.

For details see Seismo. Institute Bull. for 1955, National Observatory, Athens, 1956, pp. 27, 28.

$$A = +.7395, B = +.2869, C = +.6090; \quad \delta = +5; \quad h = -1; \\ D = +.362, E = -.932; \quad G = +.568, H = +.220, K = -.793.$$

The scanned images of the bulletins of the International Seismological Summary (ISS) have been obtained as part of a global earthquake relocation project (Villaseñor et al., 1997) initiated with funding from the US National Science Foundation through grant EAR-9725140 and collected by SGA [Storia Geofisica Ambiente](#) (Bologna) on behalf of the [Istituto Nazionale di Geofisica e Vulcanologia](#) (Rome), in the frame of [Euroseismos](#) project.

A digital hypocenter file of the ISS (Villaseñor and Engdahl, 2005) can be obtained from the USGS web site: <http://earthquake.usgs.gov/scitech/iss/>

These data are considered public domain and may be freely distributed or copied for non-profit purposes provided the previous references are quoted.
