OBSERWATORIUM GEOFIZYCZNE POLSKIEJ AKADEMII NAUK
W KRAKOWIE W LATACH 1957 i 1958

THE GEOPHYSICAL OBSERVATORY OF THE POLISH ACADEMY OF
SCIENCES IN CRACOW IN THE YEARS 1957, 1958

Stację Sejsmologiczną na Wawelu (założoną w 1955r.) prowadzono w latach 1957 i 1958 (w dalszym ciągu) jako jednostkę organizacyjną Obserwatorium Geofizycznego w Krakowie. Na omawiane lata przypadały wybrane obserwacje geofizyczne Międzynarodowego Roku Geofizycznego. W tym też czasie Obserwatorium nawiązało bliższy kontakt naukowy z Zakładem Tąpań Głównego Instytutu Górnictwa w Katowicach. Instytut był zainteresowany kławkowskimi rejestracjami (wstrząsów górnośląskich), które dostarczano mu w ramach współpracy tak szybko, jak to tylko było możliwe i to zarówno w formie wstępnych komunikatów, jak też - w pewnych przypadkach - nawet telefonicznie. GIG przesyłał Obserwatorium nawzajem rejestracje własnych stacji i ich publikacje.

Lokal Stacji wawelskiej uległ w omawianym okresie znacznemu rozszerzeniu. Uzyskano od Dyrekcji Zbiorów Sztuki na Wawelu trzecią piwnicę o powierzchni 16 m², którą zaadaptowano na potrzeby podręcznej pracowni i pokoju dla pracowników naukowych. Zainstalowano w niej aparat telefoniczny (nr 248-18). W przejętym pomieszczeniu i w pracowni fotograficznej ułożono nowe podłogi ksylolitowe, założono instalację elektryczną. Uzupełniono umeblowanie Stacji oraz wyposażenie pracowni fotograficznej.

W głównej piwnicy sejsmicznej wybudowano nowy słup betonowy (oznaczony literą C na planie reprodukowanym w Biuletynie Obserwatorium Geofizycznego w Krakowie Nr 1, str. 10). Słup izolowano od podłogi 5-centymetrową szparą. Wybudowano też jeszcze i drugi słup z cegły pod rejestrator (oznaczony literą D na wspomnianym planie). Wymienione prace wykonano w listopadzie i grudniu 1956 oraz w styczniu 1957 r.

W maju 1958 r. na słupie C ustawiono komplet sejsmografów krótkookresowych SK-58. Opis tych aparatów

zamieszczono w Acta Geophysica Polonica Vol. VII, no 2/1959. Stałe instrumentów wyznaczano w omawianym okresie czasu kilkakrotnie, jak to wynika z zestawień 1 i 2.

Zestawienie 1 SEJSMOGRAF GOLICYNA-WILIPA

Data	Składowa	T_1 (sek.)	T_2 (sek.)	D_1	D_2	δ^2	V_{st}

	E-W	1.76	0.38	0.70	3.00	0.31	6050
	Z	1.76	0.36	0.70	3.00	0.165	4000

Użyte w zestawieniu symbole oznaczają:

Symbols:

- T_1 - okres sejsmografu - seismograph period,
- T_2 - okres galwanometru - galvanometer period,
- D_1 - stała tłumienia sejsmografu - seismograph damping constant,
- D_2 - stała tłumienia galwanometru - galvanometer damping constant,
- δ^2 - współczynnik sprężenia - coupling coefficient,
- V_{st} - powiększenie statyczne - static magnification.

Charakterystyki częstotliwościowe sejsmografów w poszczególnych okresach ilustrują wykresy fig. 1, 2, 3.

Warunki termiczne piwnicy sejsmicznej kształtowały się w obu latach bardzo pomyślnie, jak to wynika z zestawień maksymalnych i minimalnych temperatur w poszczególnych miesiącach (patrz tabl. I). Różnice wartości były na ogół poniżej 1°.

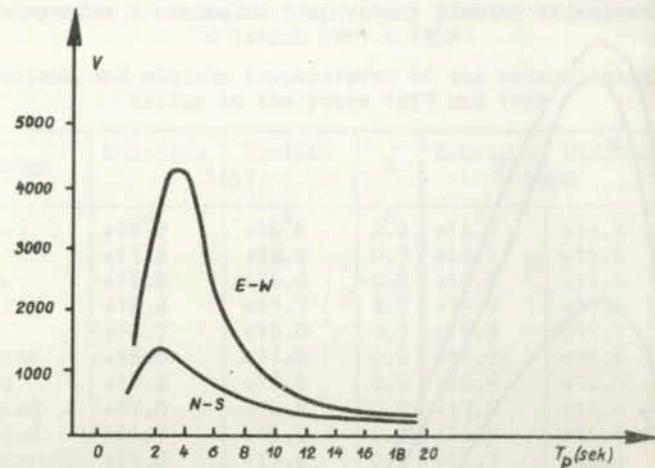

Fig. 1
Charakterystyka częstotliwościowa sejsmografów SK-58 według stałych z dnia 10 XI 1958
Frequency characteristics of the SK-58 seismographs according to the constants of November 10, 1958

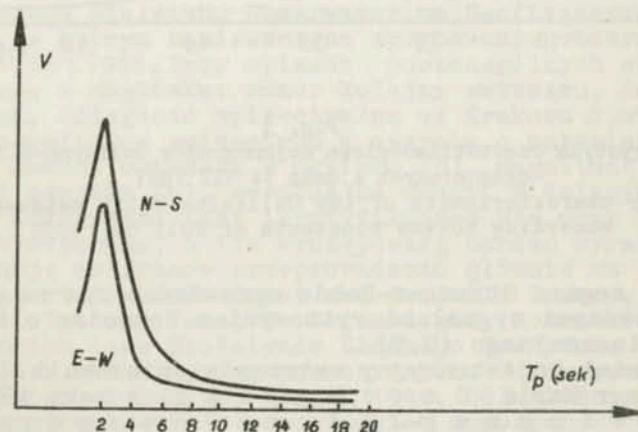

Fig. 2
Charakterystyka częstotliwościowa sejsmografów Golicyna-Wilipa według stałych z dnia 16 IX 1957
Frequency characteristics of the Galitzine-Wilip seismographs according to the constants of September 16, 1957

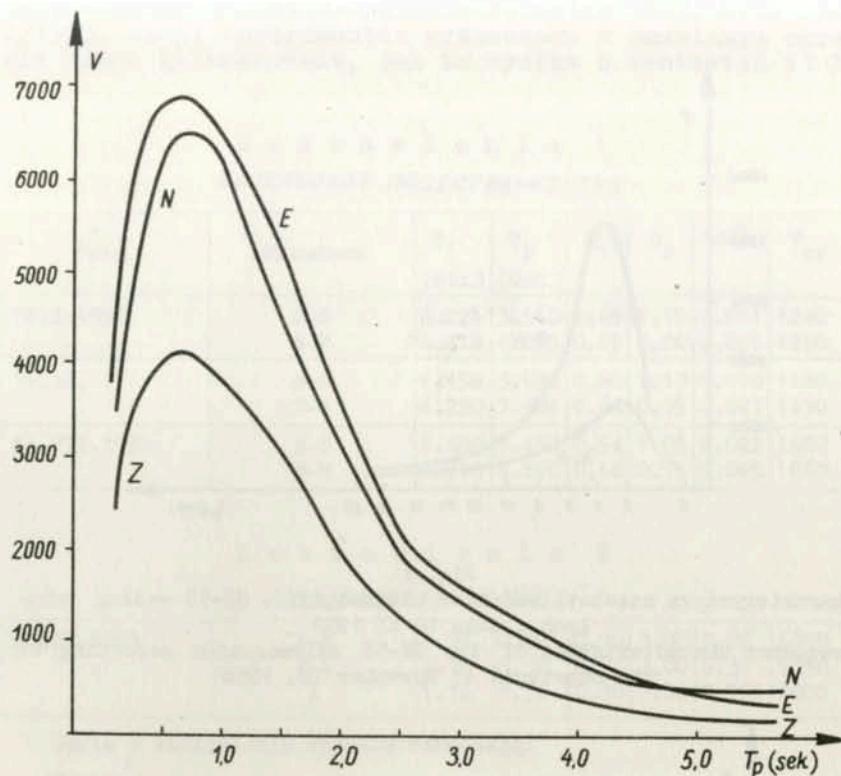

Fig. 3

Charakterystyka częstotliwościowa sejsmografów Golicyna-Wilipa według stałych z dnia 14 VII 1957

Frequency characteristics of the Galitzine-Wilip seismographs according to the constants of July 14, 1957

Chód zegara Strasser-Rohde sprawdzano raz na dobę z przyjmowanymi sygnałami rytmowymi z Pontoise o 8^h01^m czasu uniwersalnego (U.T.)

Materiał rejestracyjny wstrząsów opracowali - z roku 1957 mgr Maria Czechowicz, z roku 1958 mgr Halina Zwierzak-Jedrzewskaya pod ogólnym kierownictwem dr Janusza Pagazewskiego*.

* Opracowania materiałów rejestracyjnych wstrząsów za lata 1959, 1960, 1961, 1962 i 1963 opublikowano w tomach 3, 4, 8, 9 i 15 materiałów i prac Zakładu Geofizyki Polskiej Akademii Nauk.

Obserwacje Stacji Sejsmologicznej w Krakowie opracowano na podstawie materiałów rejestracyjnych dwóch aparatów sejsmicznych, długookresowej SGW i krótkookresowej SK-58. Zachowano sposób opisywania wstrząsów z pierwszego Biuletynu Obserwatorium Geofizycznego w Krakowie, w którym zamieszczono opracowanie obserwacji za lata 1955 i 1956. Przy opisach poszczególnych wstrząsów podawano w nagłówku: numer kolejny wstrząsu, datę, epicentrum, odległość epicentralną od Krakowa Δ , współrzędne geograficzne epicentrum w oparciu o materiały źródłowe, moment wstrząsu w ognisku (H), magnitudę (M), głębokość ogniska (h), ewentualne uwagi. W dalszym ciągu opisu wskazywano fazy identyfikujące się oraz fazy niezidentyfikowane, o ile występowały, bardzo wyraźnie. Identyfikację wstrząsów przeprowadzono głównie na podstawie materiałów U.S. Coast and Geodetic Survey, Bureau Central International de Seismologie, Roczników Czesko-Słowackich oraz Biuletynów Głównego Instytutu Górnictwa. Fazy określano za pomocą tablic Jeffreyss-Bullen Seismological Tables, London 1940. Odległości epicentralne odczytywano z odpowiednich nomogramów lub, w przypadku wstrząsów bardzo bliskich, wprost z mapy.

Biuletyn sejsmiczny Obserwatorium Geofizycznego PAN za 1957 rok obejmuje ogółem wyniki rejestracji 552 wstrząsów. Wśród tej liczby znajduje się pewna ilość niezidentyfikowanych śladów. Znaczna liczba wstrząsów, a mianowicie 141 jest pochodzenia górniczego z Górnego

Śląska albo prawdopodobnie tego pochodzenia. Tylko niewielka ilość lekkich wstrząsów jest pochodzenia zupełnie nieznanego. W tablicy II zestawiono rozkład opracowanych wstrząsów według miesięcy.

T a b l i c a II

Rozkład zarejestrowanych wstrząsów w poszczególnych miesiącach 1957 roku

Monthly distribution of registered shocks in 1957

1957	I	II	III	IV	V	VI	VII	VIII	IX	X	XI	XII	Razem
Wstrząsy	9	19	77	61	68	54	55	37	35	35	46	55	552
Górny Śląsk	-	3	22	18	24	12	13	12	9	7	11	9	141

W zestawieniu danych w tablicy II uwidacznia się nagły skok ilości rejestrowanych wstrząsów od lutego 1957 roku, wynikający z wyższej czułości uruchomionych wówczas sejsmografów Golicyna-Wilipa. Zaczęły one notować dużą ilość wstrząsów górniczych z Górnego Śląska. Podniosło to wagę materiałów Stacji, wykorzystywanych do badań wstrząsów górnośląskich, prowadzonych przez Zakład Tańca GIG oraz przez Zakład Geofizyki PAN (dr S. Gibowicz).

Biuletyn Sejsmiczny Obserwatorium Geofizycznego w Krakowie za 1958 rok zawiera opracowanie 560 wstrząsów zarejestrowanych na Stacji Sejsmologicznej na Wawelu. W tablicy III zestawiono chronologicznie miesiącami zarejestrowane w 1958 r. wstrząsy, uwzględniając ich charakter.

T a b l i c a III

Rozkład zarejestrowanych wstrząsów w poszczególnych miesiącach 1958 roku

Monthly distribution of registered shocks in 1958

Miesiąc Rodzaj wstrzą- su	I	II	III	IV	V	VI	VII	VIII	IX	X	XI	XII	Razem i %
Ślady wstrząsów niezidentyfikowanych	10	6	8	7	20	26	7	10	16	11	7	8	136 24,2%
Wstrząsy z ognisk Śląska	5	7	12	7	7	3	3	5	12	6	5	7	79 14,2%

T a b l i c a III cd.

Rodzaj wstrzą- su	Miesiąc												Razem i %
	I	II	III	IV	V	VI	VII	VIII	IX	X	XI	XII	
Wstrząsy $\Delta < 17^\circ$	3	-	6	6	14	4	5	7	7	-	1	2	55 9,8%
Wstrząsy $\Delta > 17^\circ$	26	20	18	39	34	29	18	30	23	15	26	12	290 51,8%
Razem	44	33	44	59	75	62	33	52	58	32	39	29	560 100%

Odległość $\Delta = 17^\circ$ przyjęto za granicę podziału, aby wyodrębnić wstrząsy pochodzące z obszaru Europy oraz z terenów pozaeuropejskich (Bliskiego Wschodu i północnego wybrzeża Afryki).

W latach 1957 i 1958 zegarem Stacji opiekował się Józef Janiszewski, któremu Obserwatorium z tego tytułu wiele zawdzięcza. Wdzięczność należy się też kierownictwu odbudowy zamku na Wawelu w osobie prof. Alfreda Majewskiego, pod którego nadzorem wykonano wzmiękowane adaptacje piwnicy sejsmicznej.

S u m m a r y

The Seismologic Station on Wawel, established in 1955, continued operations as an organizational unit of the Geophysical Observatory Cracow in 1957 and 1958. This period was marked by intense geophysical observation work in the I.G.Y. frame and closer scientific cooperation of the Geophysical Observatory with the Division of Mechanics of Rock Bursts of the Central Mining Institute Katowice. The Cracow records of Upper Silesian shocks, in which the latter was interested, were transmitted to the Katowice Institute at the earliest possible time (in some cases by telephone) in the form of preliminary communications. The records and publications of the Mining Institutes own station network were forwarded to the Geophysical Observatory Cracow.

The working rooms of the Wawel Seismologic Station were considerably enlarged in this period, a third cellar of 16 sq m surface having been allocated by the Direction of the Wawel Art Collections. It was adapted as a room for the scientific personnel and auxiliary

workshop. Xylolite flooring was laid in the new cellar and the photographic laboratory, the rooms were wired and a telephone was installed. Additional laboratory equipment and furniture was acquired.

In the principal seismologic cellar was mounted a new concrete pier (marked with the letter C in the plan reproduced in Nr. 1 p. 10 of the Bulletin of Cracow Geophysical Observatory), which is isolated from the floor by a 5-cm clearance. Another brick pier was mounted under the recording apparatus (marked in the abovementioned plan with letter D). The respective work was done in November/December 1956 and January 1957.

A short-period SK-58 seismograph set was installed in May 1958 on pier C. A description of this apparatus is given in Acta Geophysica Polonica vol. VII Nr. 2 ex 1959. The constants of the station instruments were repeatedly checked, those of the Golicyn-Wilip seismograph on January 17, September 16, 1957 and on July 14, 1958, those of the SK-58 seismograph on November 10, 1958.

The frequency characteristics of the seismographs for particular periods are given in figs. 1, 2, 3.

Thermal conditions of the seismologic cellars were favourable in both years as seen from the tabulation of monthly maximum and minimum temperatures (tab. I). Temperature variations were in general less than 1 centigrade.

Performance of the Strasser-Rohde clock was verified once daily by means of the rhythmic radio signals from Pontoise at 08.01 G.M.T.

The shock-recording material for 1957 was evaluated by Mgr. M. C z e c h o w i c z , that for 1958 by Mgr. H. Z w i n c z a k-J e d r z e j o w s k a under supervision by Dr. Janusz P a g a c z e w s k i*.

The observations of the Cracow Seismologic Station were worked out from the records of two seismic apparatus, the long-period SGW and the short-period SK-58. The description of shocks used in the first Bulletin of the Cracow Geophysical Observatory for 1955/1956 was maintained, giving for every shock: the order number, date, epicenter, epicentral distance from Cracow Δ , geographical coordinates of the epicenter on ground of source information, shock instant in the focus (H), magnitude (M), focus depth (h), notes (if any). The description denotes identified phases and unidentified

* Data of the shocks of 1959, 1960, 1961, 1962, 1963 comprising Materiały i Prace (Zakładu Geofizyki Polskiej Akademii Nauk) MATERIALS AND WORKS of the Institute of Geophysics Pol. Acad. Sci. vol. 3, 4, 8, 9, 15.

phases, if the latter occurred very distinctly. Identification of the shocks was made mainly by means of materials of US Coast and Geodetic Survey, Bureau Central International de Séismologie, the Czechoslovak Annals and of the Bulletins of the Polish Central Mining Institute. The phases were defined with the aid of Jeffreyss-Bullen's Seismological Tables London 1940. The epicentral distances were read from the respective nomographs or - in the case of very near shocks - directly from a map.

The Seismic Bulletin of the Geophysical Observatory Pol. Acad. Sci. for 1957 comprises a total of 552 shock records, among them a certain number of unidentified traces. A considerable part, namely 141 cases, are certainly or very probably of Upper Silesian origin, only a few light shocks being of entirely unknown. Table II gives shock distribution by months.

In table II we note from February 1957 on a sudden jump in the number of recorded shocks. This is due to the greater sensitivity of the Galitzine-Wilip seismographs installed at that time. They began to record a greater number of Upper Silesian shocks, increasing thereby the value of the material supplied by the Cracow station, which was utilized in research on the Upper Silesian shocks undertaken by the Division of Mechanics of Rock Bursts and by the Institute of Geophysics Pol. Acad. Sci. (Dr. S. G i b o w i c z).

The Seismic Bulletin of the Cracow Geophysical Observatory for 1958 contains 560 analyzed shocks recorded by the Wawel Seismologic station. In table III is given a chronologic tabulation of the 1958 shocks by months and their characteristics.

To distinguish schematically shocks from European and from non-European territories (Near East, North African coast), the distance $\Delta = 17^\circ$ was taken as the boundary.

The clock of the Seismologic Station was in 1957 and 1958 attended to by Mr. Józef J a n i s z e w s k i to whose care we are greatly indebted. Thanks are due to Professor Alfred M a j e w s k i , Director of the reconstruction work on Wawel Castle, who graciously supervised the abovementioned adaptation work in the seismological cellars.
