INTRODUCCIÓN

El **INSTITUTO GEOGRÁFICO NACIONAL** presenta con esta publicación la actividad sísmica localizada por la **Red Sísmica Nacional** durante el año de 1.990 en la Península Ibérica, áreas próximas y archipiélago Canario.

En este año la Red Sísmica se ha visto ampliada por cuatro estaciones nuevas de componente vertical de corto período situadas en Graus-Huesca (EGRA), Huescar-Granada (EHUE), Cogollos Vega-Granada (ECOG) y Cañadas-Tenerife (CCAN). La estación de Cogollos Vega sustituirá en un futuro próximo a la estación de Alfacar habiéndose cambiado entonces el enlace radio por línea telefónica directa al Centro de Recepción de Datos en Madrid. La estación CCAN está situada en el Parque Nacional del Teide en Tenerife y su señal es transmitida vía radio al CRD en Santa Cruz. También en este año se ha sustituido el enlace radio de la estación CFTV en la isla de Fuerteventura con el CRD de Santa Cruz por una línea telefónica con lo que se eliminan todos los problemas que venía ocasionando desde su instalación la transmisión entre las dos islas.

En el presente boletín están recogidos todos los sismos registrados por las estaciones de la Red Sísmica Nacional, con epicentro comprendido entre los paralelos 34°N - 44°N y los meridianos 18°W - 6°E , y que ha sido posible su localización.

Se incluye un apartado referente a la sismicidad en las Islas Canarias. En él, están incluidos los sismos con epicentro comprendido entre los paralelos 27°N - 30°N y los meridianos 19°W - 13°W .

Con el fin de precisar al máximo posible la localización, así como para la realización del cálculo del mecanismo focal, se han utilizado los datos de estaciones sísmicas dependientes de otros organismos españoles -*Hidroeléctrica de Cataluña, Observatorio del Ebro, Real Academia de Ciencias y Artes de Barcelona, Real Instituto y Observatorio de la Armada, SECEG, Servicio Geológico de Cataluña, Universidad de Granada*- y los suministrados por organismos extranjeros -*C.R.A.A.G. (Argelia), Institut de Physique de Globe de París (Francia), Laboratoire de Détection et de Géophysique (Francia), Service de Physique du Globe (Marruecos), Instituto Nacional de Meteorología e Geofísica (Portugal)*.

La información macrosísmica ha sido recopilada mediante el envío y posterior evaluación, en la escala M.S.K. de cuestionarios de información, que con la colaboración de Ayuntamientos y Puestos de la Guardia Civil son distribuidos a la población posiblemente afectada en caso de terremoto sentido. Estas encuestas se confirman con visitas a la zona por el personal de este Servicio cuando la importancia del sismo así lo requiere.

Los datos macrosísmicos en la parte francesa de los Pirineos han sido recogidos gracias a la colaboración de *Mr. Pierre Stahl*.

Las determinaciones hipocentrales han sido realizadas mediante el programa de cálculo HYPO71 de W.H.K. Lee y J.C. Lahr (1975), utilizando los modelos estratificados de corteza y la relación V_p/V_s que se muestran en la figura 1.

Para el cálculo de la magnitud se utiliza la medida de la amplitud y frecuencia en el máximo sostenido de la fase L_g , obteniéndose $m_b(L_g)$ de acuerdo con las expresiones siguientes:

$$m_b(L_g) = 3.90 + 1.05 \log(D^\circ) + \text{Log}(A/T) \quad \text{Para } D^\circ < 3^\circ$$

$$m_b(L_g) = 3.30 + 1.66 \log(D^\circ) + \text{Log}(A/T) \quad \text{Para } D^\circ > 3^\circ$$

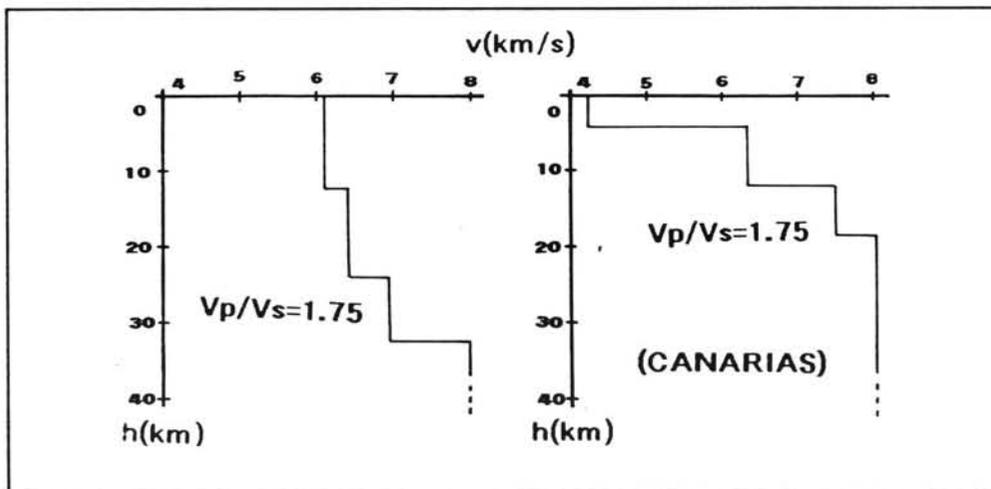

Figura 1: Modelos de corteza empleados en el cálculo de los sismos mediante el programa HYPO71.

Siendo D° la distancia epicentral expresada en grados y A/T el cociente entre la amplitud máxima de la fase L_g y su período correspondiente.

En el caso de los sismos de Canarias, la magnitud m_d , ha sido determinada en función de la duración del registro del sismo, de acuerdo con la expresión:

$$m_d = -0.87 + 2 \log(T) + 0.0035D$$

Siendo T la duración en segundos y D la distancia epicentral en kilómetros.

Para la determinación de los mecanismos focales, se ha utilizado el método numérico basado en el algoritmo de **Brillinger *et al* (1980)** que permite estimar la orientación de los ejes y planos de falla así como sus desviaciones típicas (**Udias y Buforn, 1988**).

En cuanto a la actividad sísmica del año 1990 es de destacar el terremoto que ocurrió el día 8 de marzo a las 01 horas 37 minutos (TU) en la zona de Durcal en la provincia de Granada de magnitud 4.8. Su mecanismo focal se incluye en el apartado correspondiente. Este terremoto ha sido localizado a una profundidad focal de 627 kilómetros al igual que los ocurridos el 29 de marzo de 1954 de magnitud 7.0 y el 30 de enero de 1973 de magnitud 4.0. El mecanismo focal de estos tres terremotos es del mismo tipo. Un estudio sobre este terremoto ha sido realizado por **Buforn *et al* (1991)**.

Por último y de manera extraordinaria, se publica como anexo a este boletín la traducción-adaptación de la escala de intensidades M.S.K. (64) (**Mendvedev, S.V., W. Sponheuer y V. Karnik, 1967**).

SISMICIDAD AÑO 1.990

- Resumen de sismos localizados
- Mapa de sismicidad por magnitudes
- Mapa de sismicidad por intensidades
- Datos del cálculo hipocentral

LEYENDA

FECHA	Año - mes - día
HORA	Hora origen (GMT)
LONGITUD	Longitud en grados, minutos y décimas
LATITUD	Latitud en grados, minutos y décimas
PRO	Profundidad en kilómetros
RMS	Error cuadrático medio de la hora origen, en segundos
EH	Error epicentral en kilómetros
EZ	Error en profundidad en kilómetros
NO	Número de observaciones utilizadas en el cálculo
MB	Magnitud mb a partir de la fase Lg
INT	Intensidad máxima, escala M.S.K.
+	Dispone de mapa de isosistas
P	Sismo premonitorio
R	Réplica
S	Sismo submarino, sentido en tierra
T	Sismo que ha ocasionado tsunami
M	Dispone de mecanismo focal calculado
D	Dispone de registro digital

LEYENDA

EST	Código de la estación.
I/E	Fase impulsiva (I) o emergente (E).
W	Peso de la lectura en el cálculo "4" Peso nulo. "9" Calculado con S-P.
HORA P	Hora de llegada de la primera fase. Horas minutos y segundos.
HORA S	Hora de llegada de la fase "S" correspondiente.
AMP	Amplitud del movimiento del suelo.
PER	Período en segundos.
DUR	Duración del registro del sismo en segundos.

Nota.- En el boletín sísmico del año 1989, por un error de formatos, las lecturas de las fases S figuran erróneamente. Para determinar la verdadera hora de llegada de la fase es necesario restar al tiempo de la S los segundos de P.

SISMICIDAD DE LAS ISLAS CANARIAS AÑO 1.990

- Resumen de sismos localizados
- Mapa de sismicidad por magnitudes
- Datos del cálculo hipocentral

LEYENDA

FECHA	Año - mes - día
HORA	Hora origen (GMT)
LONGITUD	Longitud en grados, minutos y décimas
LATITUD	Latitud en grados, minutos y décimas
PRO	Profundidad en kilómetros
RMS	Error cuadrático medio de la hora origen, en segundos
EH	Error epicentral en kilómetros
EZ	Error en profundidad en kilómetros
NO	Número de observaciones utilizadas en el cálculo
MD	Magnitud md a partir de la duración
INT	Intensidad máxima, escala M.S.K.
+	Dispone de mapa de isosistas
P	Sismo premonitorio
R	Réplica
S	Sismo submarino, sentido en tierra
T	Sismo que ha ocasionado tsunami
M	Dispone de mecanismo focal calculado

LEYENDA

EST	Código de la estación.
I/E	Fase impulsiva (I) o emergente (E).
W	Peso de la lectura en el cálculo "4" Peso nulo. "9" Calculado con S-P.
HORA P	Hora de llegada de la primera fase. Horas minutos y segundos.
HORA S	Hora de llegada de la fase "S" correspondiente.
AMP	Amplitud del movimiento del suelo.
PER	Período en segundos.
DUR	Duración del registro del sismo en segundos.

Nota.- En el boletín sísmico del año 1989, por un error de formatos, las lecturas de las fases S figuran erróneamente. Para determinar la verdadera hora de llegada de la fase es necesario restar al tiempo de la S los segundos de P.

ESCALA DE INTENSIDAD M.S.K.

1. DEFINICIÓN DE LA ESCALA DE INTENSIDAD M.S.K.

1.1. EFECTOS QUE DEFINEN LOS GRADOS DE INTENSIDAD M.S.K.

Los grados de intensidad de la escala M.S.K. se definen por:

- a) Los fenómenos sentidos por las personas y percibidos en su medio ambiente.
- b) Los daños producidos en las construcciones según sus diversos tipos.
- c) Los cambios advertidos en la naturaleza.

1.2. TIPOS DE CONSTRUCCIONES.

Para la estimación de los daños se consideran las construcciones no proyectadas para resistir acciones sísmicas y se clasifican en tres tipos:

Tipo A.

Con muros de ampostería en seco o con barro, de adobes, de tapial.

Tipo B.

Con muros de fábrica de ladrillo, de bloques de mortero, de mampostería con mortero, de sillarejo, de sillería, entramados de madera.

Tipo C.

Con estructura metálica o de hormigón armado.

1.3. TÉRMINOS DE CANTIDAD.

Los términos de cantidad utilizados en la definición de los grados de intensidad corresponden aproximadamente a los siguientes porcentajes:

Algunos	5 por 100
Muchos	50 por 100
La Mayoría	75 por 100

1.4. CLASIFICACIÓN DE LOS DAÑOS EN LAS CONSTRUCCIONES.

Los daños producidos en una construcción se clasifican como sigue:

Clase 1.

Daños ligeros.- Fisuras en los revestimientos, caída de pequeños trozos de revestimiento.

Clase 2.

Daños moderados.- Fisuras en los muros, caída de grandes trozos de revestimiento, caída de tejas, caída de pretilas, grietas en las chimeneas e incluso derrumbamientos parciales en las mismas.

Clase 3.

Daños graves.- Grietas en los muros, caída de chimeneas de fábrica o de otros elementos exentos.

Clase 4.

Destrucción.- Brechas en los muros resistentes, derrumbamiento parcial, pérdida del enlace entre distintas partes de la construcción, destrucción de tabiques y muros de cerramiento.

Clase 5.

Colapso.- Ruina completa de la construcción.

2. DESCRIPCIÓN DE LOS GRADOS DE INTENSIDAD M.S.K.

Grado I.

La sacudida no es percibida por los sentidos humanos, siendo detectada y registrada solamente por los sismógrafos.

Grado II.

La sacudida es perceptible solamente por algunas personas en reposo, en particular en los pisos superiores de los edificios.

Grado III.

La sacudida es percibida por algunas personas en el interior de los edificios y sólo en circunstancias muy favorables en el exterior de los mismos. La vibración percibida es semejante a la causada por el paso de un camión ligero. Observadores muy atentos pueden notar ligeros balanceos de objetos colgados, más acentuados en los pisos altos de los edificios.

Grado IV.

El sismo es percibido por muchas personas en el interior de los edificios y por algunas en el exterior. Algunas personas que duermen se despiertan, pero nadie se atemoriza. La vibración es comparable a la producida por el paso de un camión pesado con carga. Las ventanas, puertas y vajillas vibran. Los pisos y muros producen chasquidos. El mobiliario comienza a moverse. Los líquidos contenidos en recipientes abiertos se agitan ligeramente. Los objetos colgados se balancean ligeramente.

Grado V.

a) El sismo es percibido en el interior de los edificios por la mayoría de las personas y por muchas en el exterior. Muchas personas que duermen se despiertan y algunas huyen. Los animales se ponen nerviosos. Las construcciones se agitan con una vibración general. Los objetos colgados se balancean ampliamente. Los cuadros golpean sobre los muros o son lanzados fuera de su emplazamiento. En algunos casos los relojes de péndola se paran. Los objetos ligeros se desplazan o vuelcan. Las puertas o ventanas abiertas baten con violencia. Se vierten en pequeña cantidad los líquidos contenidos en recipientes abiertos y llenos. La vibración se siente en la construcción como la producida por un objeto pesado arrastrándose.

b) En las construcciones de tipo A son posibles ligeros daños (clase 1).

c) En ciertos casos se modifica el caudal de los manantiales.

Grado VI.

a) Lo sienten la mayoría de las personas, tanto dentro como fuera de los edificios. Muchas personas salen a la calle atemorizadas. Algunas personas llegan a perder el equilibrio. Los animales domésticos huyen de los establos. En algunas ocasiones, la vajilla y la cristalería se rompen, los libros caen de sus estantes, los cuadros se mueven y los objetos inestables vuelcan. Los muebles pesados pueden llegar a moverse. Las campanas pequeñas de las torres y campanarios pueden sonar.

b) Se producen daños moderados (clase 2) en algunas construcciones del tipo A. Se producen daños ligeros (clase 1) en algunas construcciones del tipo B y en muchas del tipo A.

c) En ciertos casos pueden abrirse grietas de hasta un centímetro de ancho en suelos húmedos. Pueden producirse deslizamientos en las montañas. Se observan cambios en el caudal de los manantiales y en el nivel de agua de los pozos.

Grado VII.

a) La mayoría de las personas se aterroriza y corre a la calle. Muchas tienen dificultad para mantenerse en pie. Las vibraciones son sentidas por personas que conducen automóviles. Suenan las campanas grandes.

b) Muchas construcciones del tipo A sufren daños graves (clase 3) y algunas incluso destrucción (clase 4). Muchas construcciones del tipo B sufren daños moderados (clase 2). Muchas construcciones del tipo C experimentan daños ligeros (clase 1).

c) En algunos casos, se producen deslizamientos en las carreteras que transcurren sobre laderas con pendientes acusadas; se producen daños en las juntas de las canalizaciones y aparecen fisuras en muros de piedra.

Se aprecia oleaje en las lagunas y el agua se enturbia por remoción del fango. Cambia el nivel del agua de los pozos y el caudal de los manantiales. En algunos casos, vuelven manar manantiales que estaban secos y se secan otros que manaban. En ciertos casos se producen derrames en taludes de arena o grava.

Grado VIII.

a) Miedo pánico general, incluso en las personas que conducen automóviles. En algunos casos se desgajan las ramas de los árboles. Los muebles, incluso pesados, se desplazan o vuelcan. Las lámparas colgadas sufren daños parciales.

b) Muchas construcciones de tipo A sufren destrucción (clase 4) y algunas colapso (clase 5).

Muchas construcciones de tipo B sufren daños graves (clase 3) y algunas destrucción (clase 4).

Muchas construcciones de tipo C sufren daños moderados (clase 2) y algunas graves (clase 3).

En ocasiones, se produce la rotura de algunas juntas de canalizaciones. Las estatuas y monumentos se mueven y giran. Se derrumban muros de piedra.

c) Pequeños deslizamientos en las laderas de los barrancos y en las trincheras y terraplenes con pendientes pronunciadas. Grietas en el suelo de varios centímetros de ancho. Se enturbia el agua de los lagos. Aparecen nuevos manantiales. vuelven a tener agua pozos secos y se secan pozos existentes. En muchos casos cambia el caudal y el nivel del agua de los manantiales y pozos.

Grado IX.

a) Pánico general. Daños considerables en el mobiliario. Los animales corren confusamente y emiten sus sonidos peculiares.

b) Muchas construcciones del tipo A sufren colapso 50% (clase 5). Muchas construcciones del tipo B sufren destrucción (clase 4) y algunas colapso (clase 5).

Muchas construcciones del tipo C sufren daños graves (clase 3) y algunas destrucción (clase 4).

Caen monumentos y columnas. Daños considerables en depósitos de líquidos. Se rompen parcialmente las canalizaciones subterráneas. En algunos casos, los carriles del ferrocarril se curvan y las carreteras quedan fuera de servicio.

c) Se observa con frecuencia que se producen extrusiones de agua, arena y fango en los terrenos saturados. Se abren grietas en el terreno de hasta 10 centímetros de ancho y de más de 10 centímetros en las laderas y en las márgenes de los ríos. Aparecen, además, numerosas grietas pequeñas en el suelo. Desprendimientos de rocas y aludes. Muchos deslizamientos de tierras. grandes olas en lagos y embalses. Se renuevan pozos secos y se secan otros existentes.

Grado X.

b) La mayoría de las construcciones del tipo A sufren colapso (clase 5). Muchas construcciones de tipo B sufren colapso (clase 5). Muchas construcciones de tipo c sufren destrucción (clase 4) y algunas colapso (clase 5). Daños peligrosos en presas; daños serios en puentes. Los carriles de las vías férreas se desvían y a veces se ondulan. Las canalizaciones subterráneas son retorcidas o rotas. El pavimento de las calles y el asfalto forman grandes ondulaciones.

c) Grietas en el suelo de algunos decímetros de ancho que pueden llegar a un metro. Se producen anchas grietas paralelamente a los cursos de agua. Deslizamientos de tierras sueltas en las laderas con fuertes pendientes. En los ribazos de los ríos y en las laderas escarpadas se producen considerables deslizamientos. Desplazamientos de arenas y fangos en las zonas litorales. Cambio de nivel de agua en pozos. El agua de canales y ríos es lanzada fuera del cauce normal. Se forman nuevos lagos.

Grado XI.

b) Daños importantes en construcciones, incluso en las bien realizadas, en puentes, presas y líneas de ferrocarril. Las carreteras importantes quedan fuera de servicio. Las canalizaciones subterráneas quedan destruidas.

c) El terreno queda considerablemente deformado tanto por desplazamientos horizontales como verticales y con anchas grietas. Muchos deslizamientos de terrenos y caídas de rocas.

Para determinar la intensidad de las sacudidas sísmicas se precisan investigaciones especiales.

Grado XII.

b) Prácticamente se destruyen o quedan gravemente dañadas todas las estructuras, incluso las subterráneas.

c) La topografía cambia. Grandes grietas en el terreno con importantes desplazamientos horizontales y verticales. Caídas de rocas y hundimientos en los escarpes de los valles producidas en vastas extensiones. Se cierran valles y se transforman en lagos. Aparecen cascadas y se desvían los ríos.
