INTRODUCCIÓN

El INSTITUTO GEOGRÁFICO NACIONAL presenta con esta publicación la actividad sísmica localizada por la Red Sísmica Nacional durante el año de 1.995 en la Península Ibérica, áreas próximas y archipiélago Canario.

En el presente boletín están recogidos todos los sismos localizados con epicentro comprendido entre los paralelos 34N-44N y los meridianos 18W-6E. Se incluye un apartado referente a la sismicidad en las Islas Canarias, en el que están incluidos los sismos con epicentro comprendido entre los paralelos 27N-30N y los meridianos 19W-13W.

Con el fin de precisar al máximo posible la localización, se han utilizado los datos de estaciones sísmicas dependientes de otros organismos españoles – Real Academia de Ciencias y Artes de Barcelona, Central Nuclear de Cofrentes, Consejo Superior de Investigaciones Científicas, Hidroeléctrica de Cataluña, Instituto de Estudios Catalanes, Instituto Cartográfico de Cataluña, Observatorio del Ebro, Real Observatorio de la Armada, SECEG, y los suministrados por organismos extranjeros -Centre de Documentation Seismologique (Francia), Centre National de la Recherche (Marruecos), C.R.A.A.G. (Argelia), Institut de Physique du Globe (Francia), Istituto de Meteorologia (Portugal), Istituto Nazionale di Geofisica (Italia), Laboratoire de Détection et de Géophysique (Francia), Observatoire Midi-Pyrenées (Francia), Universidad de Coimbra (Portugal), Universidad de Lisboa (Portugal), Universite Mohamed V (Marruecos).

La información macrosísmica ha sido recopilada mediante encuestas telefónicas y el envío y posterior evaluación de cuestionarios de información, en la escala M.S.K. que con la colaboración de Ayuntamientos y Puestos de la Guardia Civil son distribuidos a la población posiblemente afectada en caso de terremoto sentido. Estas encuestas se confirman con visitas a la zona por el personal de este Instituto, cuando la importancia del sismo así lo requiere. Los datos macrosísmicos en la parte francesa de los Pirineos han sido recogidos gracias a la colaboración de Mr. Pierre Stahl.

Las determinaciones hipocentrales han sido realizadas mediante el programa de cálculo HYPO71 de W.H.K. Lee y J.C. Lahr (1975), utilizando los modelos estratificados de corteza y la relación V_p/V_s que se muestran en la siguiente tabla:

PENÍNSULA $V_p/V_s=1.75$		CANARIAS $V_p/V_s=1.75$	
Capa (km)	Velocidad V_p (km/s)	Capa (km)	Velocidad V_p (km/s)
0-11	6.10	0-4	4.20
11-24	6.40	4-12	6.30
24-31	6.90	12-18	7.50
31-	8.00	18-	8.00

Para el cálculo de la magnitud se utiliza la medida de la amplitud y frecuencia en el máximo sostenido de la fase L_g , obteniéndose $m_b(L_g)$ de acuerdo con las expresiones siguientes:

$$m_b(L_g) = 3.90 + 1.05 \log(D) + \log(A/T) \quad \text{Para } D < 3 \text{ grados}$$

$$m_b(L_g) = 3.30 + 1.66 \log(D) + \log(A/T) \quad \text{Para } D > 3 \text{ grados}$$

Siendo D la distancia epicentral expresada en grados y A/T el cociente entre la amplitud máxima sostenida de la fase Lg y su período correspondiente.

En el caso de los sismos de Canarias, la magnitud ha sido determinada en función de la duración del registro del sismo, de acuerdo con la expresión:

$$md = -0.87 + 2 \log(T) + 0.0035 D$$

Siendo T la duración en segundos y D la distancia epicentral en kilómetros.
