RESULTS OF OBSERVATIONS MADE AT THE COAST AND GEODETIC SURVEY MAGNETIC  
OBSERVATORY NEAR TUCSON, ARIZONA, IN 1909 AND 1910.

INTRODUCTION.

Latitude,  $32^{\circ} 14'.8$ . Longitude,  $110^{\circ} 50'.1$ . Elevation, 770 meters (2,525 feet).

As the improvised building for the variation instruments at Baldwin, Kans., was of such a character as to detract seriously from the accuracy and value of the results obtained, and as the increasing density of population in that region presaged the introduction of electric car lines in the near future, it was decided to transfer the variation instruments from Baldwin to some place in the southwestern part of the United States. After an examination of numerous localities a site was selected about 8 miles (12.9 km.) east of the city of Tucson, Arizona.

By Executive order of June 3, 1909, the northwest quarter of section 5, township 14 south, range 15 east, Gila and Salt River meridian, containing about 173 acres, was set apart for the

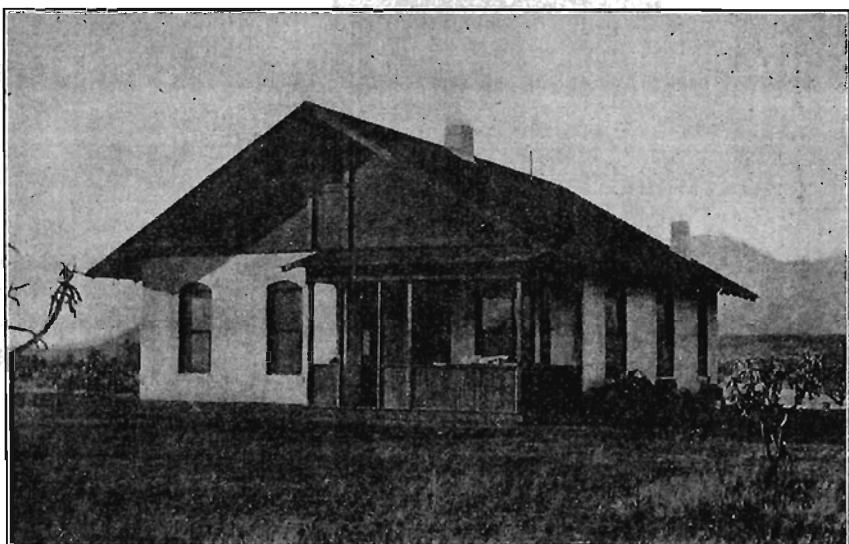

FIG. A.—Office.

use of the observatory. It is in a comparatively level and open country, rising gradually to mountains on the north and west. The plans for the observatory buildings were prepared by W. B. Keeling, magnetic observer, and their construction was begun under his direction in the latter part of June, 1909. After the death of Mr. Keeling early in July the work was put in charge of E. Mueller, assistant, and the buildings were completed under his direction. The instruments were installed by W. F. Wallis, magnetic observer, and put in operation on November 16, 1909, and he had charge of the observatory work up to the end of August, 1910, when he was relieved by L. W. Weed, magnetic observer.

BUILDINGS.

The building used as an office and quarters for the observer in charge is a little southwest of the center of the tract. It is a one-story brick building about 30 by 40 feet in size (Fig. A).

The variation building (Fig. B) is about 700 feet west of the office. It is above ground, made of wood, of the same general design as the one at Sitka, Alaska. It is 28 by 32 feet, with a vestibule on the west end 10 by 12 feet. The wall insulation, beginning from the outside, is

as follows: Six-inch free-air space (between studding); 40 inches of sawdust; 6-inch dead-air space; 26-inch air space (corridor); 15 inches of sawdust. The instrument room is 12 by 16 by 7 feet. Below this room the insulation consists of 24 inches of sawdust and a 12-inch air space next to the ground. Above the room: Two-inch air space; 13 inches of sawdust; 32-inch air space connected with the corridor; 24 inches of sawdust; open loft. To enter the instrument room one must pass through six doors, two at the entrance to the vestibule, two at the entrance of the building, and two at the entrance to the instrument room.

By this means the average diurnal variation of temperature in the instrument room is kept down to about  $0.1^{\circ}$  C., as compared with about  $20^{\circ}$  outside, but the effect of a prolonged change of temperature is more marked and the annual range is about  $15^{\circ}$ . The outer sawdust packing was not put in place until August, 1910, and its insulating effect on the inside temperature was not as much as had been expected.

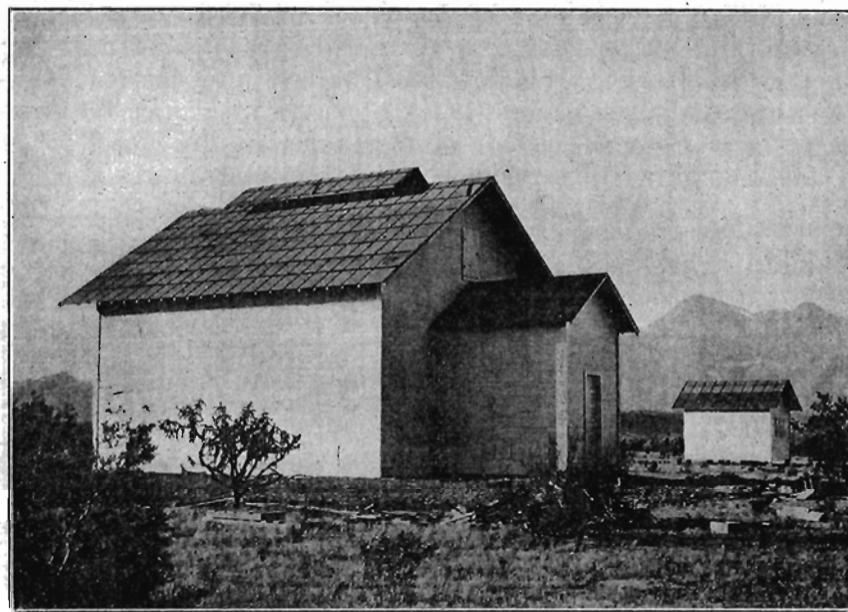

FIG. B.—Variation and absolute buildings.

*Monthly and annual range in temperature (Centigrade).*

Month	Inside of variation building				Outside of variation building		
	Maximum	Minimum	Range	Mean	Mean	Range	Average daily range

Year....	30.8	13.3	17.5	23.3	20.6	52.8	19.0

The absolute building (Fig. B) is about 100 feet north of the variation building. It is built of wood, with double walls separated by an air space of 24 inches, the inner dimensions being 8 by 12 feet.

In 1910 a seismograph building was constructed about midway between the office and the variation building. It is 7 by 10 feet inside dimensions, with concrete walls and an outer casing of plank to keep out ground water. The roof is about 4 feet above the ground level, but the excavated material was banked over it, so that it is practically an underground building.

An ample water supply is obtained from a well near the office building, 104 feet deep.

## **INSTRUMENTS.**

The instruments which had been in use at Baldwin were transferred to the Tucson observatory.

## VARIATION INSTRUMENTS.

The magnetograph is of the Eschenhagen pattern, consisting of a recording apparatus and  $D$ ,  $H$ , and  $Z$  variometers. The variometers are mounted west of the recording apparatus. Upward motion of the curves on the magnetogram corresponds to decreasing east declination, increasing  $H$  and decreasing  $Z$ . Variations in temperature are recorded by a thermograph attached to the  $Z$  variometer, but it is possible most of the time to determine the variometer temperatures directly from the morning and afternoon thermometer readings.

## ABSOLUTE INSTRUMENTS.

Absolute observations of declination and horizontal intensity were made with India Magnetic Survey pattern magnetometer No. 30. Dip observations were made with Kew dip circle No. 4655 up to December 23, 1909, and with Kew dip circle No. 15 after that date. The chronometer corrections were obtained by means of time observations with sextant, using the method of equal altitudes of the sun.

Daily meteorological observations were made with a set of instruments supplied by the United States Weather Bureau.

## CONSTANTS OF THE MAGNETOGRAPH.

## DECLINATION VARIOMETER.

The *D* variometer was mounted so that the face of the fixed mirror was 1,720 mm. from the recording cylinder. The torsion of the fiber is very small, only 3'.7 for 30° torsion and the scale value 1 mm. = 1'.00 was used.

## HORIZONTAL INTENSITY VARIOMETER.

Much difficulty was experienced in securing a satisfactory adjustment of the  $H$  variometer and frequent readjustments necessitated frequent scale-value determinations. The results show a variation of scale value with ordinate amounting to about 0.006 $\gamma$  per mm.

*H scale value.*

## EARTHQUAKES.

A Bosch-Omori seismograph was mounted in the seismograph house in September, 1910. It consists of two horizontal pendulums, one recording east-west motion (E), and the other recording north-south motion (N). Below are tabulated the earthquakes recorded up to the end of 1910:

Period of pendulums:			S. S.
September	.....		N, 7; E, 22
October, November	.....		N, 11; E, 18
December	.....		N, 20; E, 20
Magnification	.....	10	
Steady mass	.....	10-12 kg

## REMARKS.

Nos. 6 and 7: Apparently two earthquakes overlapping, the end of the first being confused by the beginning of the second.

No. 8: Apparently a very distant earthquake. Nothing shown on E.

No. 11: Paper changed between 15.26 and 15.36, and instrument not working well for a short time thereafter. Beginning of large waves and maximum doubtful.

Nos. 12, 13, 14: Very similar to each other, and probably of common origin.

## MAGNETIC STORMS.

Magnetic disturbances of considerable magnitude were recorded on the days tabulated below. The relative magnitudes are indicated by the numbers 1, 2, 3, 4. When a storm began abruptly, the time of beginning is given to the nearest minute. For comparison with similar data for other observatories, the Greenwich mean time may be found by adding 7<sup>h</sup> 23<sup>m</sup>.

On the succeeding pages will be found reproductions of the magnetograms showing the principal storms, reduced to three-fourths the original size. A storm selected for reproduction is indicated in the table by an asterisk after the date. Upward motion of the curves corresponds to decreasing east declination, increasing H and decreasing Z.

## REMARKS.

Nos. 16, 17, 18 Near-by earthquakes. - Short period waves of small amplitude. Phases not well defined.  
No. 20. E-W driving clock not running.  
No. 26. Mexican earthquake. The E-W stylus was off the paper from 11:10 to 11:23. The N-S stylus went off at 11:12 and did not come back. Recorded also on magnetogram.  
No. 33. Actual maximum at 16:50:35; 0.9 mm. on N. 0.4 mm. on E.  
No. 39. No apparent motion of E.  
No. 40. Phases of E could not be determined.  
No. 48. Principal portion lost on account of pointers going off the paper.  
Nos. 53 and 62. N record indistinct.  
No. 64. Nothing on E.  
No. 76. Phases not well marked.  
No. 79. Motion on N too slight to distinguish phases.  
No. 80. Beginning uncertain. E not running.  
No. 81. Phases not distinct.  
No. 82. Beginning on E doubtful.  
No. 83. Phases on N very doubtful.  
No. 84. Felt at Flagstaff, Ariz.  
No. 88. Phases not well defined. Possibly microseismic tremors at the beginning.  
No. 93. Near Mexico City. Recorded also on magnetogram.  
No. 96. This may be partly microseismic tremors. Nothing on N.  
Nos. 101, 102. Phases doubtful.

During July and August, 1912, the time-marking device was out of order and a uniform rate of driving clocks was assumed.

Microseismic tremors were present on October 26 and 27, November 17, 18, and 22, 1912.

## MAGNETIC STORMS.

In the table below the relative magnitude of the disturbances is indicated by the figures 1, 2, 3, 4. When a storm began abruptly the time of beginning is given to the nearest minute. For comparison with similar data for other observatories, the Greenwich mean time may be found by adding 7<sup>h</sup> 23<sup>m</sup>.

On the succeeding sheets will be found reproductions of the magnetograms showing the principal storms, reduced to three-fourths the original size. A storm selected for reproduction is indicated in the table by an asterisk after the date. Upward motion of the curves corresponds to decreasing east declination, increasing *H* and decreasing *Z*.

## EARTHQUAKES.

A Bosch-Omori seismograph has been in continuous operation since September, 1910. It consists of two horizontal pendulums, one recording east-west motion (E) and the other recording north-south motion (N). The times in the table below are Greenwich mean time, counted from midnight.

*Period of pendulums.*

		N	E
		s	s
Jan.	1-Feb.	8, 1913.....	18 18

## REMARKS.

- No. 130. E not in proper adjustment.  
 No. 132. Actual maximum (0.2 millimeter) on E occurred at 4:32:42 during first preliminary tremors.  
 No. 135. Drum of N disconnected.  
 No. 142. Maximum amplitudes greater than the values given. Both pendulums struck the limiting brushes on both sides.  
 No. 146. Phases indistinct.  
 No. 150. No definite phases on N; only a few small waves.  
 No. 152. Barely perceptible on E.  
 No. 153. Faint indications of a distant earthquake from 5.10 to 5.40 on both seismograms.  
 No. 166. On E the actual maximum (0.8 millimeter) occurred at 17:38:04.  
 No. 170. The actual maximum occurred at 12:17:11, 0.8 millimeter on N and 3.5 millimeters on E.  
 Microseismic tremors were present on July 19, 22-26; August 6, 7; September 7, 11-14, 19, 20; October 28, 29; December 18, 1913.

## MAGNETIC STORMS.

In the following table the relative magnitude of the disturbances is indicated by the figures 1, 2, 3. When a storm began abruptly the time of beginning is given to the nearest minute. For comparison with similar data for other observatories, the Greenwich mean time may be found by adding 7<sup>h</sup> 23<sup>m</sup>.

On the succeeding sheets will be found reproductions of the magnetograms showing the principal storms, reduced to three-fourths the original size. A storm selected for reproduction is indicated in the table by an asterisk after the date. Upward motion of the curves corresponds to decreasing east declination, increasing *H* and decreasing *Z*.

*Principal magnetic disturbances.*

## EARTHQUAKES.

A Bosch-Omori seismograph has been in continuous operation since September, 1910. It consists of two horizontal pendulums, one recording east-west motion (E) and the other recording north-south motion (N). The times in the table are Greenwich mean time, counted from midnight.

*Period of pendulums.*

	N	E
January to December, 1915.....	19.6	16.0
January 15 to March 31, 1916.....	19.0	15.2
April 2 to December 31, 1916.....	19.0	14.0

Magnification, 10; steady mass, 10 to 12 kg.

The nomenclature of the International Seismological Association has been used in the table to designate the different phases:

P=Beginning of first preliminary tremors.

S=Beginning of second preliminary tremors.

L=Beginning of long waves of principal portion.

M=Time of greatest amplitude.

C=End of principal portion.

F=End of visible record.

A=Maximum amplitude or one-half maximum range. The quantities given denote the actual movement of the stylus as measured on the seismogram.

## REMARKS.

- No. 190. Actual maximum, 0.5 mm. during S at 21:49:31.  
 No. 195. Probably recurrence of No. 194.  
 No. 197. Recorded on magnetograph.  
 No. 198. Stylus of E went off the paper. Recorded on magnetograph..  
 No. 199. Nothing apparent on N.  
 No. 201. Stylus of N went off the paper from 0:16:16 to 0:22:24.  
 No. 202. Probably recurrence of No. 201.  
 No. 203. Recorded by the magnetograph at 5:15.  
 No. 217. Times doubtful on N because of clock stopping.  
 No. 222. An amplitude of 0.5 mm. occurred at 4:21:10 on E. N clock stopped.  
 No. 223. N not recording.  
 No. 227. Times doubtful on N.  
 No. 228. N driving clock stopped shortly after the earthquake, making times uncertain.  
 No. 229. End probably occurred while paper was being changed.  
 No. 235. P doubtful.  
 No. 236. Began while changing paper on N.  
 No. 239. Some earlier motion, probably microseismic.

## EARTHQUAKES.

A Bosch-Omori seismograph has been in continuous operation since September, 1910. It consists of two horizontal pendulums, one recording east-west motion (E) and the other recording north-south motion (N). The times in the table are Greenwich mean time counted from midnight.

Period of pendulums—N. 18-19 sec.; E. 14 sec.

Magnification, 10.

Steady mass, 10 to 12 kg.

The nomenclature of the International Seismological Association has been used in the table to designate the different phases. The quantities given in the last column denote the actual movement of the stylus (one-half the maximum range) as measured on the seismogram.

GOVERNMENT PRINTING OFFICE  
1924

# RESULTS OF OBSERVATIONS MADE AT THE U. S. COAST AND GEODETIC SURVEY MAGNETIC OBSERVATORY NEAR TUCSON, ARIZ., IN 1919 AND 1920.

## CONTENTS.

	Page.
Introduction.....	1
Instruments.....	2
Constants of the magnetograph.....	2
Absolute observations and base-line values.....	4
Diurnal variation.....	8
Summary of monthly and annual means.....	23
Hourly values of declination, 1919.....	24
Hourly values of horizontal intensity, 1919.....	36
Hourly values of vertical intensity, 1919.....	48
Hourly values of declination, 1920.....	60
Hourly values of horizontal intensity, 1920.....	72
Hourly values of vertical intensity, 1920.....	84
Register of earthquakes.....	95
Magnetic storms.....	97

## ILLUSTRATIONS.

Figs. 1-20. Reproductions of magnetograms showing the principal magnetic storms.....	98

## INTRODUCTION.

[Latitude,  $32^{\circ} 14' .8$ ; longitude,  $110^{\circ} 50'.1$ ; elevation, 770 meters (2,525 feet).]

The Tucson Magnetic Observatory is about 8 miles (12.9 kilometers) east of the city of Tucson, Ariz., in a comparatively level country rising gradually to mountains on the north and west. The buildings were erected in the summer of 1909, and the instruments were installed and put in operation in November of that year. A description of the buildings will be found in the first volume of observatory results, for 1909 and 1910. The relative position of the office and variation buildings is there incorrectly stated, however. The variation building is about 700 feet east of the office, and the vestibule is on the east end of the variation building.

The division of terrestrial magnetism of the U. S. Coast and Geodetic Survey, of which N. H. Heck, hydrographic and geodetic engineer, is chief, includes both the office and field work. The office computations and preparation of the results for publication were in charge of the writer, assisted by W. N. McFarland, Frank Neumann, and O. S. Hill, computers. The work of the observatory was carried on by William H. Cullum, magnetic observer.

Up to the end of 1914 each hourly value of declination, horizontal intensity, or vertical intensity in the monthly tabulations represented the momentary value of the quantity for the specified hour, local mean time. Beginning with 1915 the published hourly values are average values for successive periods of an hour, beginning at midnight of the specified standard meridian (one hundred and fifth in the

**EARTHQUAKES.**

A Bosch-Omori seismograph has been in continuous operation since September, 1910. It consists of two horizontal pendulums, one recording east-west motion (E) and the other recording north-south motion (N). The times in the following table are Greenwich mean time counted from midnight.

Period of pendulums: N., 18 sec.; E., 14 sec., January to June, 1919; 17 sec., July, 1919; 15 sec., August to October, 1919; 17 sec., November, 1919, to December, 1920.

Multiplication, 10.

Steady mass, 10 to 12 kg.

The nomenclature of the International Seismological Association has been used to designate the different phases. The quantities given in the last column denote the actual movement of the stylus (one-half of the maximum range) as measured on the seismogram.

## REMARKS.

329. E out of adjustment; no well-defined long waves on N.  
 332. Instrument not in good adjustment.  
 333. Probably a near-by quake.  
 334. Stylus of N was off the paper from 21:10:05 to 21:12:53; the amplitude was measured to the edge of the paper.  
 336. No distinct phases.  
 339. Only a trace on E; N not in good adjustment.  
 340. Times somewhat uncertain because of irregular spacing of time marks; N not in operation from Aug. 23 to Nov. 15.  
 343, 344. Phases uncertain; seismograph not in good adjustment.  
 347. S uncertain.  
 355. P uncertain.  
 346, 348-357. Probably near-by.  
 360, 361, 362. Irregular record, possibly not seismic; time marks missing and times, therefore, uncertain.  
 364. Reported from Porto Rico; PR plainly shown at 22:16:30.  
 366. Phases not distinct; the one tabulated as L may be S.  
 369. Phases not distinct; times uncertain because of missing time breaks.  
 370, 371. N not in operation.  
 376. P and S not well defined.  
 377, 378. The end of one overlaps the beginning of the other.  
 379. Reported from Formosa; P and S uncertain.  
 382. Reported from Los Angeles as felt at 2:47; the phase tabulated as P occurs at about the time when L would be expected at that distance.  
 384. P and S faint; times uncertain on account of failure of time-marking apparatus.  
 385. Nothing on N.  
 387. Preliminary tremors faint on both components.  
 389. No well-defined long waves.  
 391. Another phase, probably PR, occurred on N at 22:03:50 and on E at 22:03:42.  
 392, 393, 394. Beginning faint; probably not P.  
 396, 397, 398. No well-defined long waves.  
 400. Nothing on N.  
 401. Phases not well defined.  
 402. P and S not well defined; another phase at 12:31:48.

## MAGNETIC STORMS.

Magnetic storms of considerable magnitude were recorded on the days tabulated below. When a storm began abruptly, the time of beginning is given to the nearest minute.

On the succeeding sheets will be found reproductions of the magnetograms showing the principal storms, reduced to one-half the original size. A storm selected for reproduction is indicated in the table by an asterisk after the date. Upward motion of the curves corresponds to decreasing east declination, increasing *H* and decreasing *Z*.

## INTRODUCTION

[Latitude  $32^{\circ} 14'.8$ ; longitude  $110^{\circ} 50'.1$ ; elevation, 770 meters (2,525 feet)]

The Tucson Magnetic Observatory is about 8 miles (12.9 kilometers) east of the city of Tucson, Ariz., in a comparatively level country rising gradually to mountains on the north and west. The buildings were erected in the summer of 1909 and the instruments were installed and put in operation in November of that year. A description of the buildings will be found in the first volume of observatory results for 1909 and 1910. The relative position of the office and variation buildings is there incorrectly stated, however. The variation building is about 700 feet east of the office; and the vestibule is on the east end of the variation building.

The division of terrestrial magnetism of the U. S. Coast and Geodetic Survey, of which N. H. Heck, hydrographic and geodetic engineer, is chief, includes both the office and field work. The office computations and preparation of the results for publication were in charge of the writer, assisted by W. N. McFarland, Frank Neumann, O. S. Hill, J. B. Goldsmith, and I. I. Kaplan, computers. The work of the observatory was carried on by William H. Cullum, magnetic observer, to the end of August, 1922. After that it was in charge of A. K. Ludy, magnetic observer.

## EARTHQUAKES

A Bosch-Omori seismograph has been in continuous operation since September, 1910. It consists of two horizontal pendulums, one recording east-west motion (E) and the other recording north-south motion (N). The times in the following table are Greenwich mean time counted from midnight.

Period of pendulums.—N., 18 sec. to May, 1922; 19 sec. after May, 1922. E., 17 sec.

Multiplication, 10.

Steady mass, 10 to 12 kg.

The nomenclature of the International Seismological Association has been used to designate the different phases. The quantities given in the last column denote the actual movement of the stylus (one-half of the maximum range) as measured on the seismograms.

## REMARKS

1. PR<sub>1</sub> at 8:28:08; SR<sub>1</sub> on N at 8:32:22  $\Delta = 2,580$  km.
4. Phases ill-defined on N; PP<sub>1</sub> on E at 18:38:31.
6. Beginning doubtful.
7.  $\Delta = 2,930$  km.
- 8, 10. No definite phases.
12. Phases not well defined.
16. Wind tremors obscure record on N; L<sub>E</sub> doubtful.
17. N not operating.
19. P and L interpretations doubtful; eP<sub>1</sub> at 4:25:10.
20. P interpretation doubtful.
21. P interpretation doubtful.
22. No definite L wave maximum; actual maximum at 6:23:39.
- 23, 24, 25, 26, 27. E not operating.
25. P doubtful.
26. P doubtful.
27. Recorded on magnetograph at 15:45.
- 28 to 37. N not in operation.
- 29, 30. P interpretation doubtful.
31. Record lost from 3:55 to 4:02.
33. A series of L waves begins at 9:26:47.
34. Stylus off paper from 12:26:03 to 12:29:39.
37. L doubtful. Recorded on the magnetograph.
38. No definite maximum during L; maximum on E occurs at 4:18:27; on N at 4:08:44.
- 39, 40. P interpretations doubtful.
41. Times of phases indeterminate on E on account of irregular motion of drum.
44. Additional L waves on E at 22:13:10 and 22:26:06.
46. O = 4:47:08;  $\Delta = 1,210$  km.; additional L phase on N at 4:52:34. Recorded on the magnetograph from 4:51 to 5:01.
47. An émergence on E and N at 10:47:14.
48. O = 20:59:20;  $\Delta = 500$  (?) km. Recorded on the magnetograph at 21:02. L<sub>12</sub> occurs at 21:01:32.
49. Local tremors.
50. P phases doubtful; ePR<sub>1N</sub> occurs at 13:45:20; ePR<sub>1N</sub> at 13:45:00; SR<sub>12</sub> at 13:53:31; SR<sub>1N</sub> at 13:53:20. End lost in changing paper.
- 51, 52. L interpretations doubtful.
52. Emergence on N occurs at 22:47:39.
- 53, 54, 55, 56. P interpretations doubtful.
55. Recorded on the magnetograph.
56. End portion on E masked by wind tremors.
57. O = 4:32:33;  $\Delta = 8,120$  km; PS<sub>12</sub>(?) occurs at 4:54:07; PS<sub>1N</sub> (?) at 4:53:54; SR<sub>12</sub> at 4:58:45; SR<sub>1N</sub> at 5:02:04; SR<sub>12</sub> at 5:02:04; eP<sub>1</sub> at 5:03:15; eP<sub>1</sub> at 5:03:39; L<sub>12</sub> at 5:09:59; L<sub>1N</sub> at 5:10:50; L<sub>1N</sub> at 5:09:09. SR<sub>1</sub> doubtful; F<sub>12</sub> indeterminate on account of irregular trace due to loose stylus. Recorded on the magnetograph.
58. Barely perceptible.

## INTRODUCTION

[Latitude  $32^{\circ} 14'.8$ ; longitude  $110^{\circ} 50'.1$ ; elevation, 770 meters (2,526 feet)]

The Tucson Magnetic Observatory is about 8 miles (13 kilometers) east of the city of Tucson, Ariz., in a comparatively level country rising gradually to mountains on the north and west. The buildings were erected in the summer of 1909 and the instruments were installed and put in operation in November of that year. A description of the buildings will be found in the first volume of observatory results for 1909 and 1910. The relative position of the office and variation buildings is there incorrectly stated, however. The variation building is about 700 feet east of the office, and the vestibule is on the east end of the variation building.

The division of terrestrial magnetism and seismology of the United States Coast and Geodetic Survey has supervision of the office, field, and observatory work in terrestrial magnetism. During the period covered by this report, N. H. Heck, hydrographic and geodetic engineer, was chief of this division. The work of the observatory was in charge of Albert K. Ludy, magnetic observer, during all of 1923 and 1924. The office computations and preparation of the results for publication were in charge of the author and the assistant chief of the division, D. L. Hazard, assisted by O. S. Hill and Augustine McCarthy, mathematicians, and R. R. Bodle, Louis P. Sissman, and John Hershberger, magnetic observers. The methods of observing are explained in *Directions for Magnetic Measurements*, published in 1911 (third edition in 1930).

Up to the end of 1914 each hourly value of declination, horizontal intensity, or vertical intensity in the monthly tabulations represented the momentary value of the quantity for the specified hour, local mean time. Beginning with 1915 the published hourly values are average values for successive periods of an hour, beginning at midnight according to the mean time of the one hundred and fifth meridian. Thus, a value in the column headed 1 represents the average value for the hour beginning at midnight and ending at 1 a. m., one hundred and fifth meridian mean time.

## INSTRUMENTS

### VARIATION INSTRUMENTS

The magnetograph is of the Eschenhagen pattern and consists of a recording apparatus and declination ( $D$ ), horizontal intensity ( $H$ ), and vertical intensity ( $Z$ ) variometers. The variometers are mounted west of the recording apparatus. Upward motion of the curves on the magnetogram corresponds to decreasing east declination, increasing horizontal

## EARTHQUAKES

A Bosch-Omori seismograph has been in continuous operation since September, 1910. It consists of two horizontal pendulums, one recording east-west motion (E) and the other recording north-south motion (N). The constants of the instruments were as follows:

		E.	N.
Steady mass.....	kilograms.....	10	10
Multiplication.....	do.....	10	10
Period from—			
Jan. 1, 1923.....	seconds.....	16.7	19.4
May 1, 1923.....	do.....	16.9	18.5
Dec. 1, 1923.....	do.....	17.0	19.6

The following table is a register of the earthquakes recorded by the seismograph. The time is Greenwich mean time counted from midnight. In order to find a place in the table for impulses and emergences which have not been identified with any phase of the seismogram, the times of their appearances have often been included in the column headed P, and sometimes in the columns headed S and L. The quantities given in the last column are the actual movement of the stylus (one-half of the maximum range) as measured on the seismogram.

On January 31, 1925, the President approved an act of Congress, which authorized the Coast and Geodetic Survey to make investigations and reports in seismology, and in accordance with the provisions of this act, the scope of the work of this bureau in seismology has been enlarged, and its importance has been felt to warrant the issuance of separate publications for the seismological reports. Accordingly the records of the operation of the seismograph at the Tucson Magnetic Observatory will be published hereafter in the seismological reports which are being issued, beginning with the first quarter of 1925.

## REMARKS

- Local tremors.
- O at 9:04:18, distance 1,550 km.; L<sub>2</sub> and L<sub>4</sub> on E at 9:11:43 and 9:12:46, respectively; L<sub>2</sub> on N at 9:11:36; recorded on magnetograph.
- Recorded on the magnetograph.
- O at 5:08:07, distance 8,920 km.; L<sub>2</sub> on E at 5:43:46.
- O at 16:01:41, distance 7,320 km.; P<sub>1</sub> on both at 16:12:47; e on both at 16:21:00; PS on N at 16:21:42; i on N at 16:22:51; e on E at 16:24:31 and on N at 16:25:44; e on E at 16:27:58; SR<sub>2</sub> on E at 16:30:01 and on N at 16:29:49; M off paper at 16:39:26; recorded on magnetograph.
- L<sub>4</sub> on N at 0:43:23; recorded on magnetograph.
- Local tremors.
- SR on N at 7:58:35; L<sub>2</sub> on E at 8:10:51 and on N at 8:14:27.
- Local.
- e on E at 5:03:42; local.
- Local; recorded on magnetograph.
- O at 16:28:47, distance 4,210 km.; L<sub>2</sub> on E at 16:45:01 and on N at 16:46:56.
- O at 8:18:14, distance 8,550 km.; e on E at 8:28:39, 8:38:12, and 8:41:18; records very faint.
- Local tremors.
- O at 7:30:40, distance 640 km.; recorded on magnetograph.
- O at 23:14:35, distance 1,120 km.
- O at 2:58:42, distance 9,800 km.; e on E at 3:45:26; N not in good adjustment.
- O at 2:48:22, distance 9,675 km., from L<sub>2</sub>-S<sub>2</sub>; e on E at 3:22:47; N not in good adjustment; only slight evidence of waves.
- Local shock.
- O at 1:20:49, distance 6,400 km., from L<sub>2</sub>-S<sub>2</sub>; eP<sub>1</sub> on E at 1:38:18; SR<sub>1</sub> on E at 1:44:09.
- Local shock.
- L<sub>2</sub> on E at 4:27:32; N out of order.
- O at 7:10:42, distance 7,110 km.; L<sub>2</sub> and L<sub>4</sub> on E at 7:43:21 and 7:48:05, respectively; P and S barely perceptible.
- O at 21:08:48, distance 10,040 km.; PR<sub>1</sub> on E at 21:25:40; SR<sub>2</sub> on E at 21:44:12; L<sub>2</sub> and L<sub>3</sub> on E at 21:59:09 and 22:01:45, respectively; N component not operating satisfactorily.
- e on E at 22:20:11; M<sub>2</sub> on E at 22:22:09; recorded on magnetograph; e<sub>2</sub> apparently another earthquake.
- i on E at 23:59:31; recorded on magnetograph; tremors superimposed on L<sub>2</sub>.
- 31, 34, 35, 36. No record on N.
- O at 10:07:36, distance 3,660 km.; ePR at 10:15:46; e at 10:20:21; SR at 10:22:14; L<sub>2</sub> at 10:28:15; N not operating during March.
- Interpretation based on report of Porto Rico observatory.
- O at 18:20:15, distance 12,100 km.; PR<sub>2</sub> at 18:42:17; e at 18:45:45; PS at 18:49:40; SR<sub>1</sub> and SR<sub>2</sub> at 18:55:15 and 18:59:42, respectively; e at 17:10:57; origin based on PR<sub>2</sub> and SR<sub>2</sub>; N not operating satisfactorily.
- O at 20:01:29, distance 1,720 km.; recorded on magnetograph; observed in magnetometer while making declination observations.
- M<sub>2</sub> on E at 20:21:48; record of N defective; phases not well defined.
- e on E at 1:29:09; this may not be seismic.
- N not in good adjustment.
- ePR on E at 1:57:22; PS on E at 2:07:16 and on N at 2:07:30; SR on E at 2:14:16; L<sub>2</sub> on E at 2:33:28.
- O at 15:45:05, distance 7,820 km.; no definite long waves.
- 49, 50, 51. N out of order during July.
- e on E at 18:38:35; N not operating satisfactorily during August.
- P and S extremely weak.
- N out of order during October.
- eL<sub>2</sub> at 23:38:02.
- N out of order.
